connected with descending currents from the upper regions of the solar atmosphere. The spots are limited to the region within 45° of the sun's equator, and are most numerous in latitudes from 15° to 20°, being rather scarce on the equator itself. They exhibit a marked periodicity in number: at intervals of about eleven years they are abundant, while at intermediate times they almost vanish. The explanation of this periodicity is still unknown. Numerous attempts have been made to correlate it with various periodic phenomena upon the earth—with doubtful success, however, except that there is an unmistakable (though unexplained) connection between the spottedness of the sun's surface and the number and violence of our so-called magnetic storms and auroras.

Supernatural perfection. See *perfection*. = **Syn. 1.** *Supernatural*, *Miraculous*, *Preternatural*, *Superhuman*, *Unnatural*, *Extra-natural*. That which is *supernatural* is above nature; that which is *preternatural* or *extra-natural* is outside of nature; that which is *unnatural* is contrary to nature, but not necessarily impossible. *Supernatural* is freely applicable to persons: as, *supernatural* visitants; *preternatural* sometimes; *unnatural* only in another sense. *Supernatural* is applied to beings, properties, powers, acts, in the realms of being recognized as higher than man's. In the following extract *supernatural* is used in the sense ordinarily expressed by *extra-natural* or *miraculous*.

That is *supernatural*, whatever it be, that is either not in the chain of natural cause and effect, or which acts on the chain of cause and effect, in nature, from without the chain.

H. Bushnell, Nature and the Supernat., p. 37.

The raising of the dead to life would be *miraculous*, because, if brought about by a law of nature, it would be by a law outside of and above any that are known to man, and perhaps overruling some law or laws of nature. *Preternatural* is used especially to note that which might have been a work of nature, but is not. That which is *superhuman* is above the nature or powers of man. *Superhuman* is often used by hyperbole to note that which is very remarkable in man: as, he exhibited *superhuman* strength; the other words may be similarly used in a lower sense.

II. n. That which is above or beyond the established course or laws of nature; something transcending nature; supernatural agencies, influence, phenomena, etc.: with the definite article.

As in the case of *religio*(*n*), *religio*(*n*), religion (see *religion*), the exact original sense of *superstitio*(*n*) is uncertain; it is supposed to have been a 'standing over something' in amazement or awe. The explanation (reflected, e. g., in the quot. from Lowell, below) that it means lit. 'a survival' (namely, of savage or barbarous beliefs generally outgrown) is modern, and is entirely foreign to Roman thought.] 1. = Syn. 1-3. *Superstition*, *Credulity*, *Fanaticism*, *Bigotry*. *Credulity* is a general readiness to believe what one is told, without sufficient evidence. *Superstition* may be the result of credulity in regard to religious beliefs or duties or as to the supernatural. As compared with *fanaticism* it is a state of fears on the one side and rigorous observances on the other, both proceeding from an oppression of the mind by its beliefs, while *fanaticism* is too highly wrought in its excitement for fear or for attention to details of conduct. *Fanaticism* is a half-crazy substitution of fancies for reason, primarily in the field of religion, but secondarily in politics, etc. *Fanaticism* is demonstrative, being often ready to undertake, in obedience to its supposed duty or call by special revelation, tasks that are commonly considered wicked or treated as criminal. *Bigotry* is less a matter of action: subjectively it is a blind refusal to entertain the idea of correctness or excellence in religious opinions or practices other than one's own; objectively it is an attitude matching such a state of mind. *Credulity* is opposed to *skepticism*, *superstition* to *irreverence*, *fanaticism* to *moderation*, *bigotry* to *liberalism*.

(a) The second or superior maxillary division of the fifth or trifacial nerve—a nerve of common sensation, chiefly distributed to the bones, teeth, and soft parts of the upper jaw. It leaves the cranial cavity by the foramen rotundum of the sphenoid. (b) One of several small motor branches of the facial nerve, distributed to muscles of the superior maxillary region.

II. *n.*; pl. *supramaxillaries* (-riz). The superior maxillary, or upper jaw-bone, forming a part, in man nearly the whole, of the bony framework of the upper jaw, and representing more or less of the expanse of the cheek: correlated with *inframaxillary*. The part which the supramaxillary takes in the formation of the upper jaw mostly depends upon the relative size of the premaxillary (intermaxillary) bone. In man the latter is very small, occupying only a little space at the anterior-inferior corner of the supramaxillary, and is observable only in infancy, as it speedily ankyloses with the supramaxillary. The supramaxillary is in inverse ratio extensive, and also expansive or inflated, being entirely hollowed out by the maxillary sinus, or antrum of Highmore. It presents to the cheek an external or facial surface, with several elevations

Left Supramaxillary of Man, outer surface, about two thirds natural size.

m, three molars; *pnx*, two premaxillæ; *c*, canine; *i*, two incisors, rooted in alveolar border; *an*, anterior nasal spine; *nn*, nasal notch; *np*, nasal process; *os*, orbital surface; *ms*, rough surface for articulation with malar bone; *zs*, zygomatic surface; *pd*, two posterior dental canals; *if*, incisive fossa; *cf*, canine fossa. The small upper figure shows the palatal surface of the bone of the fetus—*mx*, the true supramaxillary, being still separated by a suture, *s*, from the premaxillary, *pnx*, which will bear two incisors.

and depressions marking the attachments of muscles, and just below the eye the large infra-orbital foramen. The posterior or zygomatic surface shows the openings of the posterior dental canals, and a rough surface for articulation with the palate bone. The superior or orbital surface forms most of the floor of the orbit of the eye. The internal or nasal surface forms much of the outer wall of the nasal meatus, and shows the opening of the antrum. Besides these surfaces, the bone has several well-marked processes, as the nasal, running up to the frontal bone, the malar, articulating with the bone of that name, the alveolar, bearing teeth, and the palatal, roofing part of the mouth. The two supramaxillary bones when together show in front a somewhat heart-shaped opening, the anterior nares, at the middle of the base of which is the prominent nasal spine, a landmark in craniometry. Each articulates with nine bones (sometimes ten), and to each twelve muscles are attached. (See cuts under *skull*, *orbit*, and *palate*.) In other mammals the supramaxillary has various shapes, and is comparatively smaller; it may always be recognized as the bone which bears the upper molar, premolar, and canine teeth—all the upper teeth excepting the incisors. In birds the supramaxillary is very greatly reduced, and often not distinctly defined: the palatal part of it is represented by a well-developed maxillopalatine; but nearly the whole of the upper beak of a bird, beyond the feathers, has for its bony basis the highly developed premaxillary. In the lower vertebrates the superior maxillary is presented under the most diverse conditions of size and shape, and is generally identified with the second bone from the front of those constituting the upper maxillary arch.

-st.] One who may be *surely*
depended on.

the acid berries; *< F. suret*, dim. of *sur*, sour;
see *sour*.] A moderate tree, *Byrsnoma spicata*,
of the *Malpighiaceae*, found in the West Indies
and South America. It has a dark-colored wood,
strong and good, but not durable in contact with moisture,
and an astringent bark which is exported to England for
tanning purposes. The tree is also valued for shade in
West Indian coffee-plantations, and it bears yellow acid
berries which are edible.

surety (shōr'ti), *n.*; pl. *sureties* (-tiz). [*< ME.*
suerte, *seurte*, *< OF. seurte*, *surete*, *F. sûreté*,
< L. securita(t)-s, freedom from care or from
danger, safety, security; *LL. securita* for a
debt, etc.: see *security*, of which *surety* is a
doublet, as *sure* is of *secure*.] 1. Certainty;
indubitableness: especially in the phrase of a
surety, certainly, indubitably.

5. One who has made himself responsible for
another; specifically, in law, one who has bound
himself with or for another who remains pri-
marily liable; one who has contracted with the
creditor or claimant that he will be answerable
for the debt, default, or miscarriage of another;
one who enters into a bond or recognizance or
other obligation to answer for another's appear-
ance in court, or for his payment of a debt or
his performance of some act, and who, in case
of the principal's failure, can be compelled to
pay the debt or damages; a bondsman; a bail.

The essential elements of the relation are that the *surety*
is liable to the demandant, either directly or in the con-
tingency of non-performance by the principal, and that
the principal is liable to indemnify the *surety* against
loss or damage by reason of the engagement of the *surety*.

a phonetic spelling of *sough*, orig. a rushing
sound: see *sough*¹. The proposed derivation
from OF. *surflot*, the rising of billow upon bil-
low, is untenable. Cf. *surf*² for *sough*².] The

surface (sér'fās), *n.* and *a.* [*< OF. (and F.)*
surface, *< sur- + face*, face; taking the place
of **surfice*, *< L. superficies*, the upper side, the
top, surface: see *superficies*.] 1. *n.* 1. The
bounding or limiting parts of a body; the parts
of a body which are immediately adjacent to
another body or to empty space (or the air);
superficies; outside: distinguished as a *physi-
cal surface*.

coloured, but even this was not considered so important
as the paintings which covered the flat *surfaces* of the
walls. *J. Fergusson*, Hist. Arch., I. 370.

2. The boundary between two solid spaces not
adjacent to a third: distinguished as a *mathe-
matical surface*. A surface is a geometrical locus de-
fined by a single general and continuous condition. This
condition reduces the points of the surface to a two-
dimensional continuum, its enveloping planes to a two-
dimensional continuum, and its enveloping straight lines
to a three-dimensional continuum. A ruled surface ap-
pears to be enveloped by a one-dimensional series of
lines; but when imaginary points are considered, this is
seen not to be so. A true one-dimensional continuum
of lines requires for its determination a threefold condition,
and can contain but a finite number (or discrete infinity)
of points and of planes. The number of points or planes
of a surface which satisfy a twofold additional condition,
as that the points shall lie upon a given line, or that the
planes shall contain a given line, and the number of lines
of the surface which satisfy a threefold additional con-
dition, as that they shall belong to a given plane pencil,
are either finite or only discrete infinity. In the former
case the surface is said to be *algebraical*, in the latter
transcendental. If the imaginary elements are taken into
account, the numbers are constant whatever the special
lines or pencils to which they refer may be. The number
of points of an algebraical surface which lie upon a given
straight line is called the *order* of the surface; the num-
ber of tangent planes which contain a given line is called
the *class* of the surface; and the number of tangent lines
which belong to a given plane pencil is called the *rank* of
the surface.

3. Outward or external appearance; what ap-
pears on a slight view or without examination.

If we look below the *surface* of controversy, we shall
commonly find more agreement and less disagreement
than we had expected. *J. R. Seeley*, Nat. Religion, p. 4.

(b) The surface often originally, and better, called the *Roman surface* [discovered by Jacob Steiner (1796-1863), undoubtedly the greatest of all geometers], being a quartic surface of the third class, having three double lines. In its symmetrical form its appearance is thus described: Take a tetrahedron, and inscribe in each face a circle. There will be, of course, two circles touching at the mid-point of each edge of the tetrahedron; each circle will contain, on its circumference, at angular distances of 120°, three mid-points; and the lines joining these with the center of the tetrahedron, produced beyond the center, meet the opposite edges . . . joining the mid-points. . . . Now truncate the tetrahedron by planes parallel to the faces, so as to reduce the altitudes, each to three-fourths of the original value; and from the center of each new face round off symmetrically up to the adjacent three circles; and within each circle scoop down to the center of the tetrahedron, the bounding surface of the excavation passing through [that is, containing] the three right lines, and the sections by planes parallel to the face being in the neighborhood of the face nearly circular, but, as they approach the center, assuming a trigonal form, and being close to the center an indefinitely small equilateral triangle. We have thus the surface, consisting of four lobes united only by the lines through the mid-points of opposite edges—these lines being consequently nodal lines, the mid-points being pinch-points of the surface, and the faces singular planes, each touching the surface along the inscribed circle. Soc., V. 14.) — **Surface of aberration,** the ruled surface described in a year by the line of apparent direction of a star as affected by aberration. — **Surface of centers.** See *center*. — **Surface of discontinuity,** a vortex sheet within a fluid over which slipping takes place. — **Surface of equal head.** See *head*. — **Surface of revolution,** a surface which is generated by the revolution of a curve round an axis. — **Surface of translation.** (a) A cylindrical surface. 2. A line of joining, uniting, or closure as if by sewing, stitching, or knitting together; a seam; a raphe. Specifically (a) In *anat.*, a linear synarthrosis or immovable articulation, especially of the bones of the skull. In man and other mammals all the cranial bones excepting the lower jaw are united by joints technically called sutures, and in all vertebrates which have bony skulls the sutures are numerous, uniting most of the bones. Sutures are classified or described in various ways: (1) by the mode of apposition of the united surfaces or edges of the bones, as the *squamous* suture, the *harmonic* suture, the *dentate*, the *limbate*, etc. (see *synarthrosis*); (2) by the shape or position of the suture, as the *coronal*, *sagittal*, *lambdoid* suture (many of these sutures appear in the cuts under *cranium* and *skull*, and in most of the other skulls figured in this dictionary); (3) by the names of the two bones which are sutured, as the *frontoparietal*, *occipitoparietal*, *sphenoparietal* suture. See phrases following. (b) In *entom.*, the line along which the elytra of opposite sides meet and sometimes are confluent. (c) In *conch.*, the line of junction of the successive whorls of a univalve shell, or the line of closure of the opposite valves of a bivalve shell. (d) In *cephalopoda*, the outline of the septa of the tetrabranchiata, which resemble in some respects the dentate sutures of the cranial bones. These lines are variously traced in different cases; when they are folded the elevations or saliences are called *addites*, and the intervening depressions or reentrances are called *lobes*.

3. In *bot.*, the seam or line of junction between two edges, as between the component carpels

of a pericarp, there commonly marking the line of dehiscence. — 4. In *surg.*: (a) The uniting of the lips or edges of a wound by stitching or stitches, or in some equivalent manner. (b) One of the stitches or fastenings used to make such a union of the lips of a wound.

In adult man it is usually obliterated by confluence of the bones; when it persists, it continues the line of the sagittal suture down the middle of the forehead to the root of the nose. More accurately called *interfrontal suture*. (b) In *entom.*, same as *clypeal suture*. — **Frontoparietal suture,** the coronal suture. — **Frontosphenoid suture,** the suture between the frontal and sphenoid bones, chiefly the line of apposition of each orbital plate of the frontal with the corresponding orbitosphenoid. — **Genal suture.** See *genal*. — **Great suture.** Same as *genal suture*. — **Gular sutures.** Same as *buccal sutures*. — **Harmonic suture,** suture by means of flat rough surfaces apposed without beveling; a variety of false suture. — **Interfrontal suture,** the frontal suture. — **Intermaxillary suture,** the harmonic suture between the right and left superior maxillary bones, effected chiefly by their palatal plates and alveolar borders. — **Internasal suture,** the suture between the right and left nasal bones. — **Interparietal suture,** the sagittal suture. — **Lambdoid suture,** the occipitoparietal suture; so called because in man it presents the shape of the Greek capital letter lambda (Λ). It is noted for its irregular zigzag course and deep dentations, often including Wormian bones. — **Limbose suture,** a suture with beveled edges and toothed processes, as the coronal or frontoparietal of man. — **Mastoid suture,** the suture between the mastoid part of the temporal bone and the occipital. — **Mastoparietal suture,** the suture between the mastoid part of the temporal bone and the parietal; it is short and deeply dentated in man, and non-existent in most animals. — **Mental, metopic, nasal, neurocentral suture.** See the adjectives. — **Occipitoparietal suture,** the lambdoid suture. — **Palatine, parietomastoid, parieto-occipital suture.** See the adjectives. — **Parietosquamosal suture,** the suture between the parietal bone and the squamous part of the temporal bone. — **Parietotemporal suture,** the suture between the parietal and temporal bones. — **Petroccipital suture,** the suture between the petrous part of the temporal bone and the occipital; in man it is irregular and incomplete, interrupted by the posterior lacerate foramen. — **Petrosphenoid suture,** the suture between the petrous part of the temporal and the greater wing of the sphenoid bone; the suture between the petrosal and alisphenoid. — **Petrosquamosal suture.** See *petrosquamosal*. — **Prosternal sutures.** See *prosternal*. — **Quilled suture,** in

It is a rare articulation, occasional in man. — **Sphenopalatine suture,** the suture of the palate bone with the sphenoid. — **Sphenoparietal suture,** the suture between the parietal and alisphenoid bones. — **Sphenopetrosal suture,** the suture between the sphenoid and the petrous part of the temporal bone. — **Sphenotemporal suture,** the suture between the sphenoid and temporal bones. — **Squamosphenoid suture,** the suture between the squamosal and sphenoid bones. — **Squamous suture.** See *squamous*. — **Temporal suture.** Same as *petrosquamosal suture*. — **Transverse suture,** of man, the series of articulations of the frontal bone with the sphenoid, ethmoid, and several facial bones, extending entirely across the upper part of the face, nearly on a level with the roof of the orbits of the eyes. The bones thus sutured with the frontal are the ethmoid and sphenoid in mid-line, and the nasal, lacrymal, malar, and superior maxillary on each side. — **True suture,** suture by indented borders of bones, as in the dentate, serrate, and limbose sutures. Compare *false suture*, above.

The leading species of swallows are the barn-swallows of the genus *Hirundo*, with long deeply forked tail having the lateral feathers elongated and linear toward their ends, and with lustrous steel-blue plumage on the upper parts, and more or less rufous plumage below. The common bird of Europe is *H. rustica*; that of America is *H. erythrogastra*. They are called *barn-swallows* because they usually build their nests of straw and mud on the rafters of barns. The house-swallow or martin of Europe is *Heli-don urtica*, of a genus not represented in America. The purple martin of North America is a very large swallow, *Progne subis* or *P. purpurea*, the male of which is entirely lustrous steel-blue; several similar species of the same genus inhabit other parts of America. The most widely diffused species of the family is the bank-swallow or sand-martin, *Chiricola* or *Cotile riparia*, common to both hemispheres, of a mouse-gray and white coloration, without luster, breeding in holes in banks. Cliff-swallows are several species of the genus *Petrochelidon*, found in various parts of the world. That of the United States is *P. lunifrons*, also called *republican swallow*, *mud-swallow*, and *eaves-swallow*. These build nests almost entirely of pellets of mud stuck together in masses on the sides of cliffs, under eaves, etc. Rough-winged swallows are several forms of the genera *Psaltidoproce* and *Stelgidopteryx*, as *S. serripennis* of the United States, having the outer web of the first primary serrate with a series of recurved hooks. It is of dull-grayish coloration, resembling the bank-swallow. The white-bellied swallow of the United

White-bellied Swallow (*Tachycineta bicolor*).

States is *Tachycineta or Iridoprocne bicolor*, of a lustrous greenish-black above and snowy-white below. A still more beautiful related species is the violet-green swallow of western North America, *Tachycineta thalassina*. The Bahaman swallow, *Callichelidon cyaneiviridis*, is a beautiful swallow resembling the violet-green, with sheeny upper parts and white under parts, belonging to the Bahamas and rarely found in Florida. Swallows are mainly insectivorous birds (though some of them eat berries also), and usually capture their prey on the wing with great address. Their wings are long, pointed, and narrow-bladed, giving great buoyancy, speed, and extension of flight. The feet are small and weak, and scarcely used for progression, but chiefly for perching and clinging. The song is a varied and voluble twittering, but the American martin has a strong, rich, musical note. Swallows are in most countries migratory; and those of Europe and America have long been noted, not only for the extent, but also for the regularity, of their migratory movements. Each species has its regular time of appearing in the spring, which may be predicted with much confidence; it is, however, to some extent dependent upon the weather, or the general advancement or retardation of the opening of the season. In the autumn swallows are often governed in leaving their summer resorts by the approach of storms or cold weather, and they are thus to some extent weather-prophets. Their modes of nesting are more variable than is usually the case among birds so intimately related in other habits and in structure; and swallows also show, to an extent unequalled by other birds, a readiness to modify their primitive nesting-habits in populous regions. Thus, the nidification of the seven species of swallows which are common in the United States shows four distinct categories: (1) holes in the ground, dug

Nest of a Swallow.

by the birds, slightly furnished with soft materials: bank-swallow, rough-winged swallow; (2) holes in trees or rocks, not made by the birds, fairly furnished with soft materials: white-bellied and violet-green swallows and purple martin; (3) holes or their equivalents, not made by the birds, but secured through human agency, and

more or less furnished with soft materials by the birds: formerly no species, now six of the seven species (all excepting the bank-swallow); (4) nests elaborately constructed by the birds, plastered to natural or artificial surfaces, and loosely furnished with soft materials: the cliff-swallow and the barn-swallow, especially the former. The eggs of the swallows likewise differ more than is usual in the same family, some being pure-white, others profusely spotted. Among species in the United States, two, the barn-swallow and the cliff-swallow, lay spotted eggs; the other five, whole-colored eggs. This difference is interesting, taken in connection with the mode of breeding, since it is the general rule with birds that hole-breeders lay white eggs, and that nest-builders, especially those whose nests are elaborate and open, lay colored eggs. See also cuts under *bank-swallow*, *barn-swallow*, *eaves-swallow*, *hive-nest*, *Progne*, *rough-winged*, and *three-tailed*.

1. A large lamellirolstral palmiped bird, of the family *Anatidæ* and subfamily *Cygninæ*, with a long and flexible neck, naked lores, reticulate tarsi, and simple or slightly lobed hallux. The neck is usually held in a graceful curve while the bird is swimming; the inner flight-feathers are usually enlarged, and capable of being erected or set like sails to waft the bird over the water; and in most of the species the plumage of the adults is snow-white in both sexes. The young of the white species are usually grayish or brownish; they are called *cygnets*. Swans walk awkwardly on land, in consequence of the backward position of the legs, but their movements on the water are exceptionally graceful and stately. Hence they are very ornamental, and some of them have been kept from time immemorial in a state of domestication. Swans are chiefly herbivorous. The flesh is edible, and the plumage furnishes the valuable swan's-down. There are 8 or 10 species, found in most parts of the world, except Africa. The ordinary white swans fall into two groups—*Cygnus* proper, with a knob on the beak, and *Olor*, without a knob; the latter are also distinguished by the resonant quality of the voice, due to the convolutions of the windpipe in the cavity of the breast-bone. In Europe four kinds of swans are found: (1) the common "tame" or mute swan, usually seen in domestication, *C. gibbus* (by the rules of nomenclature also

on the wing (some feathers of which are curly), carmine and white bill, and red eyes; it is easily acclimatized, and is often seen in domestication. A gigantic fossil swan, or swan-like goose, from the bone-caves of Malta, is known as *Palæocygnus falconeri*. The popular notion that the swan sings just before dying has no foundation in fact.

The jealous swan agens hire deth that syngeth.
Chaucer, Parliament of Fowls, l. 342.

2. In *her.*, a bearing representing a swan, usually with the wings raised as it carries them when swimming. It is therefore not necessary to say in the blazon "with wings indorsed." See below.—3. In *astron.* See *Cygnus*, 2.—**Black swan.** (a) Something very rare, or supposed to be non-existent; a rara avis: used like "white crow," and some other apparent contradictions in terms. (The phrase arose at a time when only white swans were known.)

The abuse of such places [theaters] was so great that for any chaste liuer to haunt them was a black swan, and a white crowe.
Gosson, Schoole of Abuse.

(b) See def. 1.—**Chained swan**, in *her.*, a swan represented with some kind of collar about its neck, to which a chain is secured, which may be either carried to a ring or staple, or passed in a curve over the bird's neck, between its wings, or the like. The swan ducally gorged and chained is the well-known badge of the Bohuns, adopted by the Lancastrian kings.—**Demi-swan**, in *her.*, a swan with only so much of the body showing as rises above the water when it is swimming, the wings either indorsed or expanded.—**Order of the Swan**, a Prussian order founded by the elector Frederick II., Margrave of Brandenburg, in 1440, renewed by Frederick William IV., King of Prussia, in 1843.—**Swan close**, in *her.*, a bearing representing a swan with the wings close to its side.—**Wild swan**, any feral swan; specifically, *Cygnus ferus* (*C. musicus*): so called in distinction from the "tame" or mute swan. See def. 1.

(Schreber, 1789), named after Olaus Swartz (born 1760, died about 1818), a Swedish botanist.] A genus of leguminous trees, of the suborder *Papilionaceæ*, type of the tribe *Swartzieæ*. It is characterized by a variously ruptured calyx, which is entire and roundish in the bud; a corolla usually consisting of a single broad corrugated banner-petal or sometimes wanting; numerous declined and curving stamens which are nearly or quite free; and a coriaceous or fleshy ovoid or elongated pod. There are nearly 60 species, natives of tropical America, except one which is African. The leaves are odd-pinnate or sometimes reduced to a single leaflet; the flowers are commonly borne in clustered or panicle racemes. They are mostly large forest-trees yielding a very hard and durable timber. *S. tomentosa*, the panococo or palo santo tree of Guiana, becomes 60 feet high and 3 feet thick. Its bark, called *panococo-bark*, is a powerful sudorific, and yields a red juice which hardens into a blackish resin. *S. grandiflora*, of the West Indies and southward, a small tree or shrub known as *naranjillo amarillo*, also yields a valuable and very heavy wood.

From the tribe *Sophoreæ*, its nearest ally, it is also distinguished by its calyx, which is closed and entire in the bud. It consists of 6 genera, of which *Swartzia* is the type, and includes about 70 species, mainly trees with pinnate leaves, natives of tropical Africa and South America, especially of Brazil. Five or six exceptional Brazilian species have usually only ten stamens, like the type of the order.

II. *n.* A believer in the theology and religious doctrines of Swedenborg; a New Churchman. Swedenborg held Rev. xxi. 2, "And I John saw the holy city, new Jerusalem, coming down from God out of heaven," to be a prediction of the establishment of a new dispensation, the initiation of which took place by the execution of the last judgment in the spiritual world in the year 1757, whereby man was restored to moral freedom by the restriction of evil infestations, the power of which had threatened its utter extinction. In proof of this belief, his followers point to the unparalleled spiritual and material progress of mankind since that date. They were first organized in London (where Swedenborg long resided) in 1783, under the name of the "Society of the New Church signified by the New Jerusalem," usually abbreviated to New Church. Professed Swedenborgians, though widely scattered, have never been numerous; but Swedenborg himself appears not to have contemplated the formation of a separate church, trusting to the permeation of his doctrines through the existing churches. Swedenborgians believe that this process is going on, and that thus the new dispensation is making its way independently of their own organization or efforts, and even without the conscious knowledge of most of those affected by it. Swedenborg considered himself the divinely appointed herald and expounder of this dispensation, being prepared for the office by open intercourse during many years with spirits and angels (all originally human beings), and with God himself, who revealed to him the spiritual or symbolic sense of the Divine Word (which the world had not previously been in a state to receive or apprehend), setting forth spiritual and celestial truths in every part through the correspondence of all material things with the spiritual principles, good or evil, of which they are the outgrowth and manifestation. This doctrine of correspondences is the foundation of his system, which he elaborated with uniform consistency in many volumes, all first published in Latin. In this correspondence consists the pentateuchic inspiration of the Word, which includes only the Pentateuch, Joshua, Judges, Samuel, Kings, the Prophets and Psalms, the four Gospels, and the Apocalypse; the other books of the Bible are valuable for instruction, but lack this divine character.

There are 3 species, natives of Central America, Mexico, and the Antilles. The chief of these, *S. Mahagoni*, a large tree furnishing the mahogany of commerce, extends in a reduced form (50 feet high or under) to the Florida keys. It bears smooth abruptly pinnate leaves composed of obliquely ovate tapering opposite leaflets. The small flowers are borne in axillary and subterminal panicles, and are followed by five-celled septidial capsules. See *mahogany*.

2. To move on or in water by natural means of locomotion, as an animal, many of which can so move, though the water be not their natural element, and swimming not their habit. The act is accomplished in many ways, by different movements of the body or of the limbs, or by various combinations of such motions. Man swims with the arms and legs, or with the legs alone, in an attitude and with an action most like that of the frog. Ordinary quadrupeds can swim with movements of the legs much like walking. Some of these are specially fitted for swimming without decided modification of structure, as the otter, the beaver, the muskrat, though often in these cases the tail takes some part in propelling or guiding the animal; other mammals, as the pinnipeds, and especially the cetaceans and sirenians, swim more or less exactly like fishes, the propulsion being mainly from the movements of the tail and hinder part of the body, and the flippers or fins being mainly used for steering the body or guiding the course. All such mammals swim under as well as on the water. Web-footed birds, and some whose feet are scarcely or not webbed, swim on or under water, chiefly by means of the feet; but many of them accomplish a kind of flight on or in water with the wings, and use the feet chiefly as rudders. Such is especially the case with penguins, whose wings are flipper-like, and with the dippers (*Cymbulæ*), which are thrush-like birds, and fly under water as they do in the air without using their feet at all. Aquatic serpents swim with a wriggling or writhing motion of the whole body like that with which they crawl on land, in some of these, however, the tail is flattened to serve as a fin. (See *Hydrophidæ* and eels under *serpent*, *Hydrophis*, and *Platyrus*.) Aquatic anurous batrachians swim with their legs alone, when adult; their larvae (tadpoles), and all tailed batrachians, swim like fishes, by movements of the hind part of the body and tail. Aquatic turtles swim with all four legs, and especially, in the cases of the marine forms, with their enlarged fore flippers. Nearly all crustaceans are aquatic, and swim with very variously modified limbs and tail, their natatorial organs being usually abdominal or postabdominal. (See *swimmeret*, *pleopod*, *rhaphura*.) Many insects swim by the movement of specially modified legs which serve as oars, or in the cases of larvae by undulatory movements of the whole body; some swim only on their backs, and others float, walk, or run on the surface of the water. A few mollusks, with-

out shells, swim with an undulation of the body or of processes of the mantle, but their usual modes of swimming are unlike those of animals with ordinary limbs or tail; some swim by energetic flapping of bivalved shells, others by ejecting a stream of water through siphons, or by setting a sort of sail which wafts them over the water. Aquatic worms swim by wriggling the whole body, and also by the action of multitudinous parapods or cilia. Jellyfishes and comb-jellies swim by rhythmic pulsations of a swimming-bell, or of the whole body, assisted or not by the action of some special organs. Animalcules swim mainly by ciliary action, but also by changes in the shapes of their bodies, and in some cases by special formations. See *swimming-bell*, *bladder*, *fin*, *foot*.

An ungulate non-ruminant quadruped, of the family *Suidæ* in a broad sense; any hog, pig, sow, or boar; in the plural, these animals collectively. The word is commonly used in the plural, *swine*, as a collective noun, meaning several individuals of a given species, as of the domestic hog, or several kinds of swinish animals, as the hog, the wart-hog, the peccary, the babirusa, etc. The most important breeds of swine are those originated in England during the present century. Some have been produced by crossing native hogs with China and Italian (Neapolitan) breeds. Among the most prominent are the following: the Berkshires, black pigs, with white on the feet, face, tip of the tail, and occasionally on the arm, and erect ears of medium size; the Essex, black pigs of small to medium size, with small ears at first erect, later drooping; and the Yorkshires, a well-established breed of large and small hogs of white color, resembling the Suffolk breed, also with white skin and small upright ears. Neapolitans represent a breed of rather small Italian swine, seldom bred in the United States. They are described as having a bluish-plum or slaty color, the skin nearly free from hair, and the ears small, standing forward horizontally. The English varieties, especially the Berkshires, are largely bred in the United States, where are also raised a number of native breeds. The Poland-China originated during the present century in Ohio from several breeds, including some so-called China hogs. They are characterized by a dark spotted or black color, small, broad, slightly concave face, and fine, drooping ears. The Duroc-Jersey, of unknown origin, has been bred in New Jersey for many years; they are large red animals with lopped ears. The Chester white originated in Chester county, Pennsylvania. Cheshires and Victorias are white swine, originating in New York State, which do not represent distinct breeds. The disease is caused by specific bacteria, and is localized in the lungs, giving rise to pneumonia and pleurisy. The digestive tract may be secondarily involved. In such cases diphtheritic inflammation of the mucous membrane of the large intestine is present. Swine-plague is not readily distinguished from hog-cholera. In the latter disease the lesions, chiefly limited to the large intestine, are in the form of round button-shaped ulcers and diphtheritic patches. Lung-disease is slight or absent. The specific bacteria causing hog-cholera are readily distinguished from those of swine-plague, and upon this distinction the diagnosis is mainly based. The introduction of diseased swine into a herd is probably the main cause of the spreading of both maladies.

2. A mechanical device for shifting a moving body, or a current of electricity, etc., from one course or track to another. Specifically—(a) In railroads, in its simplest form, two parallel lengths of rails joined together by rods, pivoted at one end, and free to move at the other end, forming a part of the track at its junction with a branch or siding. The switch-rails rest on metal plates laid on the sleepers, and, by means of a rod fastened to their free ends, can be moved sidewise. The ends of the next pair of rails and the ends of the first pair of the siding or branch are placed side by side, so that by the movement of the switch either pair may be brought in line with the track, and any car or engine passing the switch will be guided upon the rails to which the switch is directed. Such a switch may be used to connect several lines of rails. The objection to this form of switch is that a car moving on a track not connected with the switch is liable to be derailed by running off the open ends of the track. This has led to the adoption of safety-switches, of which there are various forms. One of the most common of these is the *split switch*, in which the ends of the rails, instead of being square, are drawn out (split) to a thin edge so as to lie close against the side of the next rail. The narrow rails used are flexible and are fitted with springs, so that in the event of a displacement of the switch the lateral pressure of the wheels will cause the points to move back and thus keep the wheels on the line, the points returning to their original position by the recoil of the springs. Another form of safety-switch is designed to keep unbroken the

Warburton, Note on Pope's Fourth Pastoral. (*Latham*.)

The affronts which his poverty emboldened stupid and low-minded men to offer him [Johnson] would have broken a mean spirit into *sycophancy*, but made him rude even to ferocity. *Macaulay*, Johnson.

sycophant (sik'ō-fant), *n.* and *a.* [*Formerly also sycophant*; *< F. sycophante* = *Sp. sicofante* = *It. sicofanta*, *< L. sycophanta*, *sucophanta*, *ML. also sicophanta*, *sicophantus*, *sicophans*, *< Gr. συκοφάντης*, an informer, a slanderer, a trickster, appar. *< σῦκον*, a fig, *+ φαίνεσθαι*, show, declare. The name would thus mean lit. 'fig-shower,' of which the historical origin is unknown. (a) According to ancient writers, it originally applied to 'one who informed on another for the exporting of figs from Attica' (which is said to have been forbidden); or (b) to 'one who informed on another for plundering sacred fig-trees'; (c) a third explanation makes it orig. 'one who brings figs (hidden in the foliage) to light by shaking the tree,' hence 'one who makes rich men yield tribute by means of false accusations.' All these explanations are doubtless inventions. (d) The real explanation appears to lie in some obscure use of *σῦκον*, fig, this word, and the *L. ficus*, fig, with its Rom. forms, being found in various expressions of an obscene or abusive nature. This origin, whatever its particular nature, would explain the fact, otherwise scarcely explicable, that the original application of the term is without record.] **I.** *n.* 1. A tale-bearer or informer in general.

The poor man that hath naught to lose is not afraid of the *sycophant* or promoter.

Holland, tr. of *Plutarch's Morals*, p. 261. (*Trench*.)

This ordinance is in the first table of Solon's laws, and therefore we may not altogether discredit those which say they did forbid in the old time that men should carry figs out of the country of Attica, and that from thence it came that these pick-thanks, which bewray and accuse them that transported figs, were called *sycophants*.

North, tr. of *Plutarch*, p. 77.

The laws of Draco . . . punished [it] [theft] with death; . . . Solon afterwards changed the penalty to a pecuniary mulct. And so the Attic laws in general continued, except that once, in a time of dearth, it was made capital to break into a garden and steal figs; but this law, and the informers against the offence, grew so odious that from them all malicious informers were styled *sycophants*: a name which we have much perverted from its original meaning. *Blackstone*, Com., IV. xvii.

syenite (sī'e-nit), *n.* [*< L. syenites, sc. lapis, lit. 'stone of Syene,' < Syene, < Gr. Συήνη, a locality of upper Egypt.*] A rock composed of feldspar and hornblende, with or without quartz. The name *syenites* was given by Pliny to the red granitoid rock extensively quarried at Syene in Egypt. The term *syenite* was introduced into modern geological science by Werner, in 1788, but applied by him to a rock (from the Pläusscher Grund, near Dresden) not identical in composition with the *syenites* of Thuy, which latter is a hornblende granite, or granite in which mica is replaced by hornblende, whereas the rock which Werner called *syenite* is mainly made up of a mixture of feldspar and hornblende; hence there has long been more or less confusion in regard to the nomenclature of this rock. The English and some continental geologists have defined syenite as an aggregate of quartz, feldspar, and hornblende; while the Germans have generally regarded the quartz as not being an essential constituent of the rock. This latter view is that which has been adopted in the most recent English geological and lithological works. Syenite is a rock thoroughly crystalline in texture, and in general it much resembles granite in its mode of occurrence. The feldspathic ingredient is chiefly orthoclase, and this usually predominates considerably in quantity over the associated minerals; there is some trichite feldspar present, however, in most syenites, and the same is true in regard to quartz, biotite, titanite, magnetite, apatite, zircon, and various other accessory minerals frequently found in small quantity in the granitic rocks. Sometimes the hornblende is replaced by augite; this variety is designated *androsyenite*; that in which mica predominates is known as *microsyenite* or *microsyenite*. The range of syenite in geological age is similar to that of granite, and the frequent passage of one rock into the other shows how closely allied the two are, one result of which condition is that the nomenclature of the different varieties is correspondingly difficult. Typical syenite is by no means abundant, and in general the granitic rocks very considerably surpass the syenitic in economic importance. Also *stenite*.

syenitic (sī'e-nit'ik), *a.* [*< syenite + -ic.*] Containing syenite; resembling syenite, or possess-

ing some of its properties. Also *syenitic*.—**Syenitic granite**, granite which contains hornblende.—**Syenitic porphyry**, fine-grained syenite containing large crystals of feldspar.

If it [Cypriote syllabary] had not been . . . superseded, it would doubtless have gradually lost its *syllabic* character, and have become the definitive alphabet of Greece, and therefore of civilized Europe and of the western world.

The same sign, once attached to a word, . . . could be used in writing for the phonetic value of this word, with a complete loss of the primitive sense. . . . syllabication (si-lab-i-kā'shon), *n.* [*< syllabicate + -ion.*] The formation of syllables; especially, the division of a word into its constituent syllabic parts in writing and printing. The division of a word of more than one syllable into separate syllables is in great measure an artificial process, since a consonant intervening between two vowels is usually (see under *syllable*) to be reckoned as belonging to either one of them not less properly than to the other. This is especially true of the continuant consonants, the semivowels

and the fricatives (thus, *follow*, *arrow*, *ever*, *lesser*, *ashes*, etc.); a mute, particularly a surd mute (*p*, *t*, *k*), has more claim to go with the following vowel, because a mute is much more distinctly audible upon a following than after a preceding vowel (in *tea* than in *ate*). We tend also to reckon such a consonant to the vowel of whose force and pitch it seems most to partake; and, along vowel being regularly a diminuendo utterance, the strength of impulse falling off before it is ended, a following consonant seems naturally to belong to the vowel that succeeds (so *dayly*, *ci-ther*, *ea-sy*, etc.); on the other hand, a consonant of any kind after a short accented vowel so shares the latter's mode of utterance as to be naturally and properly combined with it: thus, *bitter* (*bitter*), *tackle* (*tackle*), *hon-est*, etc. When two or more actually pronounced consonants come between vowels, it makes a difference whether they are or are not such as readily in our practice combine as initials before a vowel: thus, as we say *ply*, we divide *supply* into *su-pli*, not *sup-li*; but *subject* only into *sub-jekt*. As for syllabication in printing (when a word has to be broken at the end of a line), that is a different and more difficult matter, partly because many silent consonants (especially in the case of doubled consonants) have to be dealt with; it also pays much regard to the history of a word, dividing this generally, so far as possible, into the parts of which it is etymologically composed; and it has some arbitrary and indefensible usages, such as the invariable separation of *-ing*, by which we get such offenses against true pronunciation as *rag-ing*, *fac-ing*, instead of *rag-ging*, *fac-ting*; and even *miz-ure*, *funct-ure*, instead of *miz-ture*, *funct-ture*, owing to the notion that *-ure* rather than *-ture* is the ending.

syllable (sil'ā-bl), *n.* [Formerly also *sillable*, *syllabe*, *syllab*; < ME. *sillable*, < OF. *sillable*, *sillable* (with unorig. *-le*, as in *principle*, etc.), prop. *syllabe*, *sillabe*, < OF. *syllabe* = F. *syllabe* = Sp. *silaba* = Pg. *syllaba* = It. *silaba* = G. *silbe*, < L. *syllaba*, ML. also *sillaba*, < Gr. σύλλαβῃ, a syllable, several sounds or letters taken or joined together, lit. a taking together, < σύλλαβεῖν, take together, put together, < σύν, with, together, & λαμβάνειν, λαβεῖν, take.] 1. The smallest separately articulated element in human utterance; a vowel, alone, or accompanied by one or more consonants, and separated by these or by a pause from a preceding or following vowel; one of the successive parts or joints into which articulated speech is divided, being either a whole word, composed of a single vowel (whether simple or compound) with accompanying consonants, or a part of a word containing such a vowel, separated from a preceding or following vowel either by a hiatus (that is, an instant of silence) or, much more usually, by an intervening consonant, or more than one. Syllables are the separate successive parts into which the ear apprehends the continuous utterances of speech as divided, their separateness consisting mainly in the alternation of opener and closer elements, or vowels and consonants. A normal syllable is a vowel utterance attended with subsidiary consonantal utterances. As to what sounds shall have vowel value in syllable-making, different languages differ: English allows, besides those usually called vowels, also *l* and *n*, as in *reckon* (rek-n), *reckoned* (rek-nəd), *riddle* (rid-l), *riddles* (rid-lz). If the vowel is attended by both sonant and surd consonants, the sonant are in general nearer it, as in *print*, *flirt*; and also, as in the same words, the opener sounds are nearer it than the closer. But the intricacy of construction of English syllables is tolerated by but few languages; and many (as the Polynesian) will bear nothing more than a single consonant to a vowel, and that one only before it. The assignment of a consonant or of consonants in syllabication to the preceding or the following vowel is in great part a matter of convention, depending on no real principle: thus, in *alley*, for example, the *l* is a division between the two vowels, like a wall between two fields, belonging to one no more than to the other. It is on syllabic division that the "articulate" character of human speech depends. (See *articulate*. Also compare *vowel* and *consonant*.) In prosody syllables are classed as *long*, *short*, and *common* (see these adjectives). See also *time*.

syllogism (sil'ô-jizm), *n.* [Formerly also *sillogism*, *sillogisme*; < ME. *sillogisme*, *silogisme*, < OF. *sylogisme*, *sillogisme*, *F. syllogisme* = Sp. *silogismo* = Pg. *silogismo* = It. *silogismo*, *silogismo*, < L. *syllōgismus*, < Gr. *σύνλογισμός*, a reckoning all together, a reasoning, a conclusion, < *συνλογίζεσθαι*, bring together premises, infer, conclude, < *σύν*, together, < *λογίζεσθαι*, reason, < *λόγος*, word, something spoken: see *Logos*.] **1.** A logical formula consisting of two premises and a conclusion alleged to follow from them, in which a term contained in both premises disappears: but the truth of neither the premises nor the conclusion is necessarily asserted.

This definition includes the *modus ponens* (which see, under *modus*), the formula of which is that from the following from an antecedent of a consequent, together with the antecedent, follows the consequent. This depends upon two principles—first, the principle of identity, that anything follows from itself; and, secondly, the principle that to say that from A it follows that from B follows C is the same as to say that from A and B follows C. Under the former principle comes the formula that the following from an antecedent of a consequent follows from itself, and this, according to the second principle, is identical with the principle of the *modus ponens*. But the syllogism is often restricted to those formulae which embody the *nota nota* (or maxim, *nota nota est nota rei ipsius*), which may be stated under the form—from the following of anything from a consequent follows the following of the same thing from the antecedent of that consequent. Under this form it is the principle of contraposition. The simplest possible of such syllogisms is like this: Enoch was a man; hence, since being mortal is a consequence of being a man, Enoch was mortal. All syllogisms except the *modus ponens* involve this principle. A syllogism which involves only this principle, and that in the simplest and directest manner, like the last example, is called a *syllogism in Barbara*. In such a syllogism the premise enunciating a general rule is called the *major premise*, while that which subsumes a case under that rule is called the *minor premise*. A syllogism whose cogency depends only upon what is within the domain of consciousness is called an *explicatory* (or *analytic*) *syllogism*. A syllogism which supposes (though only problematically) a generalizing character in nature is called an *ampliative* (or *synthetic*) *syllogism*. (See *explicative inference* (under *inference*), and *induction*, 5.) Analytic syllogisms are either necessary or probable. Necessary syllogisms are either non-relative or relative. Non-relative syllogisms are either categorical or hypothetical, but that is a trifling distinction. They are also either direct or indirect. A direct syllogism is one which applies the principle of contraposition in a direct and simple manner. An indirect syllogism is either

minor or major. A minor indirect syllogism is one which from the major premise of a direct (or less indirect) syllogism and a consequence which would follow from its conclusion infers that the same consequence would follow from the minor premise. The following is an example: All men are mortal; but if Enoch and Elijah were mortal, the Bible errs; hence, if Enoch and Elijah were men, the Bible errs. A major indirect syllogism is one which from the minor premise of another syllogism and a consequence from the conclusion infers that the same thing would follow from the major premise. Example: All patriarchs are men; but if all patriarchs die, the Bible errs; hence, if all men die, the Bible errs. Such inversions may be much complicated: thus, No one translated is mortal; but if no mortals go to heaven, I am much mistaken; hence, if all who go to heaven are translated, I am much mistaken. To say that from a proposition it would follow that I err when I know I am right would amount to denying that proposition, and, conversely, to deny it positively would amount to saying that, if it were true, I should be wrong when I know I am right. A denial is thus the precise logical equivalent of that consequence. An indirect syllogism in which the contraposition involves such a consequence is said to be of the second or third figure, according as its indirection is of the minor or major kind. The fourth figure, admitted by some logicians, depends upon contraposition of the same sort, but more complicated, like the last example. The first figure comprises, in some sets of logic, the direct syllogism only; in others, the direct syllogisms together with those which are otherwise assigned to the fourth figure. (See figure, 9.) The names of the different varieties, called *moods of syllogism*, are given by Petrus Hispanus in these hexameters:

Barbara: Celarent: Darii: Ferio: Baralipton:

Celantes: Dabitis: Fapesmo: Frisesomorum:

Cesare: Camestres: Festino: Baroco: Darapti:

Felapton: Disamis: Datisi: Bocardo: Peripon.

(See these words, and *mood*, 2.) Probable deductive syllogisms are really direct statistical inferences (which see, under *inference*). The following is an example: In the African race there are more female than male births; the colored children under one year of age in the United States at the time of the census of 1880 form a random sample of births of Africans; hence, there should be more females than males under one year of age among the colored population of the United States in 1880. The conditions of the validity of such a syllogism are two: first, the character forming the major term (here that of the relative numbers of females and males) must be taken at random—that is, it must not be one which is likely to be subject to peculiar uniformities which could affect the conclusion; second, the minor term, or sample taken, must be numerous and a random sample—that is, not likely to be of a markedly different character from that which is general in the class sampled. The conclusion is probable and approximate—that is, the larger the sample is the smaller will be the probable error of the predicted ratio. Synthetical or ampliative syllogisms are indirect probable syllogisms. The major indirect probable syllogism is induction (which see). The following is an example: The colored children under one year of age in the United States in 1880 form a random sample of births of Africans; but if there ought to have been more males than females among those children, the colored population of the United States is very different from the bulk of Africans; hence, if in the African race in general there are more male than female births, the colored population of the United States is very different from the bulk of Africans. It must be remembered that an observation of a ratio is never exact, but merely admits of some values and excludes others; its denial excludes the former, and admits the latter. The denial of a statistical rule is thus itself a statistical rule; and hence such forms as the following are indirect probable syllogisms: American colored children under one year of age in 1880 form a sample of African births; among these the females are in excess; hence, in African births generally the females are probably in excess. The minor indirect probable syllogism is hypothetical inference. (See *hypothesis*, 4.) Relative syllogisms are those which involve other than merely transitive relations. These were first studied by De Morgan, and afterward by an American logician, but were involved in much difficulty until another American student, O. H. Mitchell, furnished in 1882 the clue to their unravelment. Every relative syllogism has at its core a non-relative syllogism, but this is generalized in a peculiar way—namely, every relative term refers to two or more universes, which may be coextensive, or may be entirely unlike as universes of material things, of space, of time, of qualities, etc. A relative proposition refers to some or all of each of several universes, and the order of the reference is material. (See *proposition*, 3.) Transpositions, identifications, and diversifications are performed upon principles now clearly made out. An important circumstance in regard to relative syllogism is that the same premise may be repeatedly introduced with new effect. Among relative syllogisms are comprised all the elements of mathematical reasoning, especially the Fermatian inference, the syllogism of transposed quantity, and the peculiar reasoning of the differential calculus.

2. Deductive or explicatory reasoning as opposed to induction and hypothesis: a use of the term which has been common since Aristotle.

Allow some principles or axioms were rightly induced, yet nevertheless certain it is that middle propositions cannot be deduced from them in subject of nature by *syllogism*—that is, by touch and reduction of them to principles in a middle term. Bacon, *Advancement of Learning*, ii.

sylyph (sil'f), *n.* [*< D. sylphe, sylfe* = *G. sylph* = *Dan. sylf* = *Sw. sylfe*, < *F. sylphe* = *Sp. sylfo* = *Pg. sylpha*, < *NL. sylpha*, a fictitious name, found in Paracelsus, appar. < *Gr. αἰθήρ*, a kind of beetle. Other names of elemental spirits *gnymph, gnome, salamander* are taken from the Gr., only one (*nymphe*) having such use in Gr., the others being, like *sylyph*, arbitrary. The spelling *sylyph* (*NL. sylpha*), with *y* instead of *i*, seems to have been used to make it look more like *nymphe*, and because to occultists and quacks like Paracelsus words spelled with *y* look more Greek and convincing. As *salamander*, orig. 'a kind of lizard supposed to live in fire,' was made, by an easy transfer, to mean 'a

spirit of fire,' and *gnome*, quite arbitrarily (see *gnome*), was made to mean 'a spirit of earth,' so *sylyph*, orig. (in the Gr. αἰθήρ) 'a beetle or insect,' seems to have been taken as 'a light flying creature,' hence 'a spirit of the air.' According to Littré the name was based on an Old Celtic word meaning 'genius,' given in the Latinized plural forms *sulph, sylfi, sylphi, m., sulevæ, sulevæ, f.* 1. An imaginary being inhabiting the air; an elemental spirit of the air, according to the system of Paracelsus, holding an intermediate place between material and immaterial beings. Sylphs are male and female, have many human characteristics, and are mortal, but have no soul. The term in ordinary language is used as feminine, and often applied figuratively to a young woman or girl of graceful and slender proportions.

I should as soon expect to meet a nymph or a sylph for a wife or a mistress.

Sylvia (sil'vi-ä), *n.* [*NL. (Scopoli, 1769)*, also *Silvia* (Cuvier, 1800), < *L. silva, sylva*, a wood, a forest.] 1. In *ornith.* (a) A genus of small denitrostral or turdoid oscine passerine birds, typical of the family *Sylviidæ*; the warblers proper. This genus was originally constituted for a part of the Linnæan genus *Motacilla*, and has been loosely used for several hundred small warbler-like birds of both hemispheres, now dissociated in different families. The name is commonly attributed to Latham (1790), but was first used by Scopoli in 1769. The type is now assumed to be the common white-throat, *Motacilla sylvia* of Linnæus, *Sylvia cinerea* of Bechstein, also called *S. rufa*; and the term is restricted to a few very closely related species of chiefly Palearctic warblers, of small size, with scutellate tarsi, bristled gape, twelve tail-feathers, axillaries never yellow, first primary spurious, and the bill strictly sylvine. Some of the leading species in this narrow sense are *S. nisoria*, the barred warbler; *S. hortensis*, the pettichaps or garden-warbler (see cut under *pettichaps*); *S. curruca*, the lesser whitethroat; *S. atricapilla*, the blackcap; *S. orpheus*, the orphean warbler. These, like *S. cinerea*, are all found in Great Britain. No bird of this genus occurs in America, though most of the American warblers which were known to the older ornithologists were placed in *Sylvia*. (b) [*l. c.*] A warbler; a species of the genus *Sylvia*, or some similar bird. — 2. In *entom.*: (a) A genus of dipterous insects. *Desrois*, 1830. (b) A genus of arachnidians. *Gerais*, 1849.

II. n. One of the warblers; a member (a) of the genus *Sylvia* or family *Sylviidæ* of the Old World, or (b) of the family *Mniotiltidæ* of America. See these words, and *warbler*.

Sylvian² (sil'vi-an), *a.* [*< Sylvius* (see def.) + *-an*.] Relating or named from the anatomist Jacques Dubois, Latinized *Sylvius* (1478–1555): specifically applied in anatomy to several parts. — *Sylvian aqueduct*. It is the most marked and persistent of all the fissures, recognizable in some animals the surface of whose cerebrum is otherwise perfectly smooth; in man it is very deep, and incloses the island of Reil, or insula constituted by the gyri operi. The name is sometimes restricted to the posterior or horizontal branch of the fissure, or that part which is commonly present in other animals than man. — *Sylvian ventricle*, the camera, pseudocoele, or so-called fifth ventricle of the brain.

In *conch.*, a genus of pulmonate gastropods, of the family *Helicidæ*. *Humphreys*, 1797. — 3t. In *ornith.*: (a) A genus of American warblers, proposed by Swainson in 1827, for many years in use, and giving name to the family *Sylvicolidæ*. It was based upon the blue yellow-backed warbler, *S. americana*, subsequently named the type of the genera *Chloris* (Boie, 1826), *Parula* (Bonaparte, 1838), and *Compsothlypis* (Cabanis, 1850), and generally applied to the species of *Dendrocæa* and some related genera before the recognition of the fact that the name was preoccupied. It fell into disuse about 1842, and the name of the family has since been changed to *Mniotiltidæ* or *Dendrocæidæ*. See these family names. (b) A genus of Old World warblers, based by Eyton upon *Sylvia sylvicola*, the wood-warbler, now known as *Phylloscopus sibilatrix*.

Sylviidae (sil'vi-dē), *n. pl.* Same as *Sylviidae*.

Sylviidae (sil'vi-i-dē), *n. pl.* [NL., < *Sylvia* + *-idae*.] A family of small oscine passerine birds, of the denti-rostral, turdiform, or cichlomorph series, named from the genus *Sylvia*; the Old World warblers. The limits of the family, like those of its representative genus, have fluctuated widely, and no exclusive diagnosis is practicable. As compared with *Turdidae*, the *Sylviidae* differ in the usually unspotted plumage of the young birds, which differ little from the adults. Compared with *Muscicapidae*, the *Sylviidae* lack the breadth and flatness of the bill which characterize the true flycatchers, and the great development of the rictal bristles. The family is very widely distributed in the eastern hemisphere, but is scarcely represented in America, where the birds formerly classed as *Sylviidae* are, with very few exceptions, *Mniotiltidae*, having but nine primaries and being otherwise quite different. The *Sylviidae* include many modern genera, and are variously subdivided. In one classification they are made to consist of 7 subfamilies—*Drymaceinae*, *Calamherpinae*, *Phylloscopinae*, *Sylviinae*, *Ruticillinae*, *Saxicolinae*, and *Accentorinae*. See cuts under *nightingale*, *Phylloscopus*, *petti-chaps*, *pine-pine*, *whetstar*, and *accentor*.

sylviiform (sil'vi-i-fōrm), *a.* [*< NL. *sylvii-formis*, < *Sylvia* + *L. forma*, form.] Having the form or structure of the *Sylviidae*; of or pertaining to the *Sylviiformes*.

Besides the warblers proper, the group is made by its author to embrace the bush-babblers, thickheads, titmice, vireos, wrens, and others.

Sylviinae (sil'vi-i-nē), *n. pl.* [NL., < *Sylvia* + *-inae*.] 1. The *Sylviidae* as a subfamily of some other family, as *Turdidae*.—2. A restricted subfamily of *Sylviidae*, represented by *Sylvia* and five or six closely related genera, especially characteristic of the Palearctic region. See cut under *Phylloscopus*.

symmetry (sim'e-tri), *n.* [Formerly also *symmetrie, symmetrie*; *< OF. symmetrie, F. symétrie = Sp. simetría = Pg. simetría = It. simetría, simetría = D. symmetrie = G. symmetrie = Sw. Dan. symmetri, < L. symmetria, < Gr. συμμετρία, agreement in dimensions, arrangement, etc., due proportion, < συμμετρος, having a common measure, commensurate, even, proportionate, moderate, in due proportion, symmetrie, < σύν, with, + μέτρον, measure.] 1. Proportionality; commensurability; the due proportion of parts; especially, the proper commensurability of the parts of the human body, according to a canon; hence, congruity; beauty of form. The Greek word *συμμετρία* was probably first applied to the commensurability of numbers, thence to that of the parts of a statue, and soon to elegance of form in general.*

2. The metrical correspondence of parts with reference to a median plane, each element of geometrical form having its counterpart upon the opposite side of that plane, in the same continued perpendicular to the plane, and at the same distance from it, so that the two halves are geometrically related as a body and its im-

age in a plane mirror: so, usually, in geometry. Especially, in *arch.*, the exact or geometrical repetition of one half of any structure or composition by the other half, only with the parts arranged in reverse order, as notably in much Renaissance and modern architecture—for instance, in the placing of two spires, exact duplicates of each other, on the front of a church. Such practice is very seldom followed in the best architecture, which in general seeks in its designs to exhibit harmony (see *harmony*, 3), but avoids symmetry in this sense.

We have an Idea of *Symmetry*; and an axiom involved in this Idea is that in a symmetrical natural body, if there be a tendency to modify any member in any manner, there is a tendency to modify all the corresponding members in the same manner.

Whewell, *Philos. of Inductive Sciences*, I. p. xxx.

John and Jeremiah sat in *symmetry* on opposite sides of the fireplace; in very smiles on their honest faces seemed drawn to a line of exactitude.

Mrs. Gaskell, *Sylvia's Lovers*, xiv.

3. The composition of like and equally distributed parts to form a unitary whole; a balance between different parts, otherwise than in reference to a medial plane: but the mere repetition of parts, as in a pattern, is not properly called *symmetry*.—4. Consistency; congruity; keeping; proper subordination of a part to the whole.

It is in exact *symmetry* with Western usage that this great compilation was not received as a code until the year 1369. Stubbs, *Medieval and Modern Hist.*, p. 167.

5. In *biol.*: (a) In botany, specifically, agreement in number of parts among the cycles of organs which compose a flower. See *symmetrical*, 3. (b) In zoölogy and anatomy, the symmetrical disposition or reversed repetition of parts around an axis or on opposite sides of any plane of the body. *Symmetry* in this sense is something more and other than that due proportion of parts noted in def. 1, since it implies a geometrical representation approximately as in def. 2 (see *promorphology*); it is also to be distinguished from mere metamorphism, or the serial repetition of like parts conceived to face one way and not in opposite directions; but it coincides in some cases with *actinomerism*, and in others with *antimerism* or *platymerism* (see *antimerism*, *platymerism*). Several sorts of symmetry are recognized. One is *radial* or *actinomerism*, in which like parts are arranged about an axis, from which they radiate like the parts of a flower, as in many zoöphytes and echinoderms; but such symmetry is unusual in the animal kingdom, being mainly confined to some of the lower classes of invertebrates, and even in these the departures from it are frequently obvious. (See *bivium*, *trivium*, and cuts under *echinopædium* and *Spatangoidæ*.) The tendency of animal form on the whole being to grow along one main axis (the longitudinal), with symmetrical duplication of parts on each side of the vertical plane (the meson) passing through that axis, it follows that the usual symmetry is *bilateral* (see below). This is exhibited only obscurely, however, by some cylindrical organisms, as worms, whose right and left "sides," though existent, are not well marked; and to such symmetry of ringed or annulose forms the term *zonal* is sometimes applied. When the ordinary metamorphic divisions of any animal, as a vertebrate or an arthropod, are conceived as not simply serial but also as antitropic, such disposition of parts is regarded as constituting *anteroposterior symmetry*, in which parts are supposed to be reversed repetitions of each other on opposite sides of an imaginary plane dividing the body transversely to its axis, in the same sense that right and left parts are reversed repetitions of each other in bilateral symmetry. The existence of the last is denied or ignored by those who consider the segments of an articulate or vertebrate body as simply serially homologous; but in the view of those who recognize it the back of the arm corresponds to the front of the thigh, the convexity of the elbow (backward) to the convexity of the knee (forward), the extensor brachii to the extensor cruris, etc. Anteroposterior symmetry is also recognized by some naturalists in certain arthropods from the arrangements of the legs (in amphipods, for example), the correspondences observed between anal and oral parts, etc. Since any body is a solid, and therefore may be intersected by three mutually perpendicular planes, two of which are concerned in bilateral and anteroposterior symmetry respectively, a kind of symmetry called *dorsobdominal symmetry* is recognized by some, being that of parts lying upon opposite sides of a longitudinal horizontal plane passing through the axis of the body, as that between the neural and hernal arches of a vertebra: but it is generally obscure, and probably never perfect. *Bilateral symmetry* (see *antileptal*) is the nearly universal rule in vertebrates and arthropods. The chief departures from it in vertebrates are in the family of flatfishes or flounders (as the plaice, turbot, halibut), in parts of the cranium of various cetaceans and the single great tusk of the narwhal, in the skulls (especially the ear-parts) of sundry owls, in the beak of a plover (*Anarhynchus*) which is bent sidewise, in the atrophy of one of the ovaries and oviducts in most birds, and in the position finally assumed by the heart and great vessels and most of the digestive organs of vertebrates at large. (See cuts under *asymmetry*, *narwhal*, *plaice*, and *plover*.) In articulate notable exceptions to it are seen in the difference between the great claws or chela of a lobster, etc. In *Mollusca* asymmetry is the rule rather than the exception. (See *Anisopleura*, *Isoleptura*.) A certain symmetry, apart from that exhibited by an animal body as a whole, may be also predicated of the several components of any part in their respective selves: as, the *symmetry* of a carpus or of a tarsus whose several bones are regularly disposed on each side of its axial plane, or around a central bone. (See cuts under *carpus* and *tarsus*.)

—*Axis of symmetry*. See *axis*.—*Center of symmetry*. See *center*.—*Kinetical symmetry*, the equality of the principal axes of a body through its center of mass.—*Plane of symmetry*, a symmetrical or median plane.—*Quartic symmetry*. See *quartic*.—*Quintic symmetry*, regularity of form depending on a pentagon being regular. See *quintic*.—*Radial symmetry*. See def. 5 (b).—*Rectangular or right symmetry*, symmetry depending on that of the right angle, or consisting in some angle being a right angle.—*Skew symmetry*. See *skew*.—*Uniform symmetry*, in *arch.*, such disposition of parts that the same ordonnance reigns throughout the whole.—*Syn. Symmetry, Proportion*. *Proportion* is the more general word, being applicable to numbers, etc.; it is also the more abstract. *Symmetry* is limited to the relation of the parts of bodies, especially living bodies: as, *symmetry* in the legs of a horse; it is thus sometimes more external. *Symmetry* sometimes is more expressive of the pleasure of the beholder. "*Symmetry* is the opposition of equal quantities to each other. *Proportion* the connection of unequal quantities with each other. The property of a tree in sending out equal boughs on opposite sides is *symmetrical*. Its sending out shorter and smaller toward the top, *proportional*. In the human face its balance of opposite sides is *symmetry*, its division upbore, *proportion*." (Ruskin.)

sympalmograph (sim-pal'mô-gráf), *n.* [*Gr.* *σύν*, together, + *παλμός*, vibration (< *πάλειν*, vibrate), + *γράφειν*, write.] A kind of apparatus used to exhibit Lissajous curves (see under *curve*) formed by the combination of two simple harmonic motions. A convenient form employs a double pendulum, the rate of oscillation of whose parts can be varied at will, while a suitable style traces out upon a lamplack surface the curves resulting from the combined motions.

sympathetic (sim-pa-thet'ik), *a.* and *n.* [*Cf.* *sympatheticus* (in technical use); < *LGr.* *συμπαθητικός*, having sympathy, < *Gr.* *συμπαθεῖν*, sympathize: see *sympathy*.] *I. a.* 1. Pertaining to, expressive of, proceeding from, or exhibiting sympathy, in any sense; attended with sympathy. Cold reserve had lost its power In sorrow's sympathetic hour. Scott, *Rokeby*, v. 11. The *sympathetic* or social feelings are not so strong between different communities as between individuals of the same community. Calhoun, *Works*, I. 9. It is a doctrine alike of the oldest and of the newest philosophy that man is one, and that you cannot injure any member without a *sympathetic* injury to all the members. Emerson, *West Indian Emancipation*. The sentiment of justice is nothing but a *sympathetic* affection of the instinct of personal rights—a sort of reflex function of it. H. Spencer, *Social Statics*, p. 116.

2. Having sympathy or common feeling with another; susceptible of being affected by feelings like those of another, or of altruistic feelings which arise as a consequence of what another feels. Your *sympathetic* Hearts she hopes to move. Prior, Epilogue to Mrs. Manby's *Lucius*. Wiser he, whose *sympathetic* mind Exults in all the good of all mankind. Goldsmith, *Traveller*, l. 43.

3. Harmonious; concordant; congenial. Now o'er the soothed accordant heart we feel A *sympathetic* twilight slowly steal. Wordsworth, *An Evening Walk*.

My imagination, which I suppose at bottom had very good reasons of its own and knew perfectly what it was about, refused to project into the dark old town and upon the yellow hills that *sympathetic* glow which forms half the substance of our genial impressions. H. James, Jr., *Trans. Sketches*, p. 291.

4. In *anat.* and *zool.*, effecting a sympathy or consensaneous affection of the viscera and blood-vessels; uniting viscera and blood-vessels in a nervous action common to them all; inhibitory of or controlling the vital activities of viscera and blood-vessels, which are thereby subjected to a common nervous influence; specifically, of or pertaining to a special set of nerves or nervous system called the *sympathetic*. See below.—5. In *acoustics*, noting sounds induced not by a direct vibration-producing force, but by vibrations conveyed through the air or other medium from a body already in vibration. The phenomena of resonance are properly examples of sympathetic sound.—*Sympathetic headache*, pains in the head as the result of comparatively distant irritations.—*Sympathetic ink*. See *ink*.—*Sympathetic nerve*, a nerve of the sympathetic system; in particular, one of the two main gangliated cords extending the whole length of the vertebral column. These ganglia, in man, correspond in number to the vertebrae against which they lie, except in the neck, where there are three pairs, and on the coccyx, where there is but a single one, the ganglion impar. Communicating branches, *rami communicantes*, *rami viscerales*, to and from the spinal and some of the cranial nerves, unite the sympathetic system with the cerebrospinal axis. The branches of distribution of the sympathetic system supply chiefly the trunk-viscera and the walls of the blood-vessels and lymphatics. The sympathetic nerves differ from the cerebrospinal nerves in having generally a grayish or reddish color, and in the greater number and more widely distributed ganglia connected with them. The sympathetic nerve is also called *great sympathetic*, *triple ganglionic*, *ganglionic*.—*Sympathetic nervous system*. (a) In vertebrates, a set of nerves consisting essentially of a longitudinal series of ganglia on each side of the spinal axis, connected by commissures or commissural nerve-fibers, forming a double chain from head to tail, and giving off numerous branches which form special plexuses

in the principal cavities of the body, and other plexuses surrounding and accompanying the viscera and blood-vessels, distinct from but intimately connected by anastomoses with the nerves of the cerebrospinal system. In man the sympathetic system consists (1) of the two main gangliated chains above described; (2) of four pairs of cranial ganglia; (3) of three great gangliated plexuses or sympathetic plexuses, in the thoracic, abdominal, and pelvic cavities respectively; (4) of smaller ganglia in connection with the abdominal and other viscera; (5) of communicating nerves or commissures, whereby these ganglia or plexuses are connected with one another and with nerves of the cerebrospinal system; (6) of distributory nerves supplying the viscera and vessels, whereby the sympathetic reaches all parts of the body. See *ganglion* and *plexus*. (b) In invertebrates, as *Vermes*, a posterior part of the visceral nervous system, passing on to the enteric tube, and corresponding to a true enteric nervous system: so called in view of its physiological relations, without reference to the actual homology implied with the sympathetic system of a vertebrate.—*Sympathetic numbers*, numbers absurdly supposed to have a tendency to come together by chance.—*Sympathetic ophthalmia*, inflammation of one eye due to lesion in the opposite eye.—*Sympathetic powder*. See *powder*.—*Sympathetic resonance*, the communication of vibration from one sounding body to another in its proximity. Thus, if two musical strings are stretched over the same sounding-board and one of them is struck, the other will vibrate also if tuned to the same note, or, further, if tuned to give the octave or the fifth.—*Sympathetic sounds*, sounds produced by means of vibrations caused by the vibrations of some sounding body, these vibrations being communicated by means of the air or some intervening liquid or solid body.—*Sympathetic string*, in various classes of stringed musical instruments, a string that is intended to be sounded by sympathetic vibration, and not by direct excitation.

II. *n.* 1. The sympathetic nervous system, or the sympathetic nerve.—2. One who is peculiarly susceptible, as to hypnotic or mesmeric influences; a sensitive. Favorable conditions may make any one hypnotic to some extent, in a degree sufficient, perhaps, to dull the physical vision and excite the mental vision. Naturally enough a company of *sympathetics* may be similarly influenced. N. A. Rev., CXLVI. 705.

sympathetical (sim-pa-thet'ik-əl), *a.* [*Cf.* *sympathetic* + *-al*.] Same as *sympathetic*. *Sympathetical* and vital passions produced within ourselves. Bentley.

sympathetically (sim-pa-thet'ik-əl-i), *adv.* In a sympathetic manner; with sympathy, in any sense; in consequence of sympathy, or sympathetic interaction or interdependence. *sympatheticism* (sim-pa-thet'ik-sizm), *n.* [*Cf.* *sympathetic* + *-ism*.] A tendency to be sympathetic, especially an undue tendency; fondness for exhibiting sympathy: used in a disparaging sense. Penelope . . . received her visitors with a piteous distraction which could not fail of touching Bromfield Corey's Italianized *sympatheticism*. Howells, *Silas Lapham*, xxvii.

sympatheticus (sim-pa-thet'ik-us), *n.*; pl. *sympathetici* (-sī). [NL.: see *sympathetic*.] The sympathetic nerve. *sympathise*, *sympathiser*. See *sympathize*, *sympathizer*.

sympathist (sim'pa-thist), *n.* [*Cf.* *sympath-y* + *-ist*.] One who feels sympathy; a sympathizer. Coleridge.

sympathize (sim'pa-thiz), *v.*; pret. and pp. *sympathized*, ppr. *sympathizing*. [Formerly also *sympathize*: < *F.* *sympathiser* = *Sp.* *simpatizar* = *Pg.* *sympathizar* = *It.* *simpatizzare*; as *sympath-y* + *-ize*.] *I. intrans.* 1. To have or exhibit sympathy; be affected as a result of the affection of some one or something else. Specifically—(a) To share a feeling, as of bodily pleasure or pain, with another; feel with another. The mind will *sympathize* so much with the anguish and debility of the body that it will be too distracted to fix itself in meditation. Buckminster. (b) To feel in consequence of what another feels; be affected by feelings similar to those of another, commonly in consequence of knowing the other to be thus affected. There was but one sole man in all the world With whom I e'er could *sympathize*. B. Jonson, *Volpone*, iii. 2. A good man can usually *sympathize* much more with a very imperfect character of his own type than with a far more perfect one of a different type. Lecky, *Europ. Morals*, I. 164.

(c) To be affected sympathetically; respond sympathetically to external influences of any kind. In the great poets there is an exquisite sensibility both of soul and sense that *sympathizes* like gossamer sea-moss with every movement of the element. Lowell, *Among my Books*, 2d ser., p. 250.

(d) To agree; fit; harmonize. A worke t' admire, That aire should meet with earth, water with fire. And in one bodie friendlie *sympathize*, Being so manifestlie contraries. Times' Whistle (E. E. T. S.), p. 116.

2. To express sympathy; condole. [Colloq.] —3t. To be of like nature or disposition; resemble.

The men do sympathize with the mastiffs in robustious and rough coming on. *Shak.*, *Hen. V.*, iii. 7. 158.

II. *trans.* 1. To have sympathy for; share in; participate in.

All that are assembled in this place,
That by this sympathized one day's error
Have suffered wrong, go keep us company.
Shak., *C. of E.*, v. 1. 397.

2. To form with suitable adaptation; contrive with congruity or consistency of parts; match in all the concomitants of; harmonize in all the parts of. [Obsolete or archaic in both uses.]

Arm. Fetch hither the swain; he must carry me a letter.
Moth. A message well sympathized; a horse to be ambassador for an ass. *Shak.*, *L. L. L.*, iii. 1. 52.

Also spelled *sympathise*.

sympathizer (sim'pā-thī-zēr), *n.* [*< sympathize + -er*]. One who sympathizes with or feels for another; one who feels sympathy. Also spelled *sympathiser*.

sympathy (sim'pā-thī), *n.*; pl. *sympathies* (-thiz).

[Formerly also *sympathic*, *sympathic*; = *F. sympathie*, *sympathia* = *Sp. simpatía* = *Pg. sympathia* = *It. simpatia*, *< L. sympathia*, *< Gr. συπαθήα*, fellow-feeling, community of feeling, sympathy, *< συ-παθής*, having a fellow-feeling, affected by like feelings, sympathetic, also exciting sympathy, *< συ-*, with, + *παθός*, feeling, passion; see *pathos*. Cf. *apathy*, *antipathy*.] 1. Feeling identical with or resembling that which another feels; the quality or state of being affected with feelings or emotions corresponding in kind if not in degree to those which another experiences: said of pleasure or pain, but especially of the latter; fellow-feeling; commiseration; compassion. In writers not quite modern an occult influence of one mind (or body) by another is meant, but this meaning is now almost forgotten.

This is by a natural *sympathie* between the eare and the eye, and between tunes & colours.

Puttenham, *Arte of Eng. Poesie*, p. 70.

In order to awaken something of sympathy for the unfortunate natives.

Burke, *Fox's East India Bill*.

The word *sympathy* may also be used on this occasion, though the sense of it seems to be rather more extensive. In a good sense, it is styled benevolence; and, in certain cases, philanthropy; and, in a figurative way, brotherly love; in others, humanity; in others, charity; in others, pity and compassion; in others, mercy; in others, gratitude; in others, tenderness; in others, patriotism; in others, public spirit.

Bentham, *Introductio to Morals and Legislation*, x. 25.

Although we commonly have in view feeling for pain rather than for pleasure when we talk of sympathy, this last really includes both.

J. Sully, *Outlines of Psychol.*, p. 510.

It is true that *sympathy* does not necessarily follow from the mere fact of gregariousness. Cattle do not help a wounded comrade; on the contrary, they are more likely to dispatch him.

W. James, *Prin. of Psychology*, II. 210.

2. An agreement of affections or inclinations, or a conformity of natural disposition which makes two persons agreeable each to the other; mutual or reciprocal inclination or affection; sympathetic interest: in this sense commonly followed by *with*: as, to have sympathy with a person in his hopes, aspirations, or aims.

Yea, I think there was a kind of sympathy betwixt that valley and him.

Bunyan, *Pilgrim's Progress*, ix.

Priscilla's silent sympathy with his purposes, so unalloyed with criticism, and therefore more grateful than any intellectual approbation, which always involves a possible reserve of latent censure.

Hawthorne, *Blithedale Romance*, ix.

To cultivate sympathy, you must be among living creatures, and thinking about them.

Ruskin.

3. In *physiol.* and *pathol.*: (a) That state of an organ or a tissue which has a certain relation to the condition of another organ or tissue in health and disease; a related state of the vital manifestations or actions in different organs or tissues, such that when one part is excited or affected others are also affected; that relation of the organs and parts of a living body to each other whereby a disordered condition of one part induces more or less disorder in another part: as, for example, the pain in the brow caused by taking a draught of cold water into the stomach, the pain in the right shoulder arising from disease of the liver, or the irritation and vomiting produced by a tumor of the brain. (b) The influence which the physiological or pathological state of one individual has in producing the same or an analogous state in another at the same time or in rapid succession, as exemplified in the hysterical convulsions which affect a number of women on seeing one of their companions suffering from hysteria, or the yawning produced by seeing an

other yawn.—4. Physical action at a distance (so used by old writers against astrology, who argue that the influence of the stars is not physical sympathy and not moral sympathy, and therefore does not exist at all): as, the sympathy between the lodestone and iron.

What we call sympathies and antipathies depending indeed on the peculiar textures and other modifications of the bodies between whom these friendships and hostilities are said to be exercised, I see not why it should be impossible that there be a cognition betwixt a body of a congruous or convenient texture and the effluvia of any other body.

Boyle, *Hidden Qualities of Air*.

5. In *acoustics*, the fact, condition, or result of such a relation between two vibratile bodies that when one is thrown into vibration the other tends to vibrate in a similar or related way, in consequence of the vibrations communicated to it through the air or some other medium.—**Powder of sympathy.** See *powder*. = *Syn. I. Commiseration, Compassion*, etc. (see *pity*); tenderness.—2. Affinity, harmony.

(Rafinesque, 1815, as Symphemia)*, *< Gr. σύμφημι*, agreeing with, *< συμφάναί*, agree with, *< σύν*, together, + *φάναί*, speak, say.] A genus of American limicoline gallinular birds, having the toes basally webbed and the bill comparatively thick; the semipalmated tattlers, or willets. They are among the larger birds of their tribe, with stout bill and feet, the latter bluish, and two decided basal webs instead of one. The wings are white-mirrored and black-lined, and the whole plumage is variegated. The common willet of North America is *S. semipalmata*; a second species or subspecies is *S. speculiferus*. The genus is also called *Catoptrophorus* or *Catoptrophonus*, and also *Udallia*. See cuts under *semipalmated* and *willet*.

symphenomena (sim-fō'nom'e-nä), *n. pl.* [*< LGr. συμφαινόμενα*, ppr. of *συμφαίνεσθαι*, appear along with or together, *< Gr. σύν*, with, together, + *φαίνεσθαι*, appear; see *phenomenon*.] Phenomena of a kind or character similar to others exhibited by the same object. *Stormonth*.

Symphonia² (sim-fō'ni-ä), *n.* [*NL. (Linnaeus filius, 1781)*, named from the regular flowers and fruit; *< L. symphonia*, a plant so called (var. *symphonaca*), appar. an amaranth, *< Gr. συμφωνία*, symphony: see *sympathy*.] A genus of polypetalous plants, of the order *Guttifera* and tribe *Moronobee*. It is characterized by globose flowers with short sepals, erect convolute petals, and a columnar stamen-tube of five elongated lobes bearing three or four anthers below the apex. The 5 species are all confined to Madagascar. They are trees or shrubs with thin but coriaceous leaves having crowded parallel veins proceeding from the midrib. The large terminal flowers are commonly scarlet and grouped in somewhat umbellate panicles, followed by globose or oval berries.

The hog-gum tree is referred by some to this genus as *S. globulifera*. See *Moronobee*, *hog-gum*, and *karamani-resin*.

symphonic (sim-fon'ik), *a.* [= *F. symphonique*; as *symphon-y + -ic*. Cf. *L. symphoniacus*, *< Gr. συμφωνιακός*, pertaining to music or to a concert.] 1. Of or pertaining to symphony, or harmony of sounds; symphonious. *Imp. Dict.*—2. Having the same sound, as two words; homophonic; homophonous; homonymous.

Mr. Sweet is now engaged on a work which gives him special facilities of comparing whole classes of symphonic words with each other and their earlier forms.

J. A. H. Murray, *Address to the Philol. Soc.*, May 21, 1880

(in *Trans. Philol. Soc.*, 1880, p. 149).

3. In *music*, pertaining or relating to or characteristic of a symphony: as, a composition in symphonic form.

Schumann's First Symphony . . . as a whole . . . has no superior in all symphonic literature.

The Nation, Nov. 29, 1883.

Symphonic poem, in *music*, a work of symphonic dimensions, but free in form, like an overture, based on a specified poetic subject: an elaborate kind of program-music especially favored by Liszt.

symphonion (sim-fō'ni-on), *n.* [*NL.*, *< Gr. συμφωνία*, a union of sound: see *symphony*.] A combination of pianoforte and harmonium, invented by F. Kaufmann in 1839, which was the precursor of the orchestron.

A consonance or harmony of sounds agreeable to the ear, whether the sounds are vocal or instrumental, or both.

The Poetes cheife Musicke lying in his rime or conorde to heare the *Symphonie*, he maketh all the hast he can to be at the end of his verse, and delights not in many staves by the way, and therefore giueth but one Cesure to any verse.

(b) Same as *ritornelle*. (c) An elaborate composition in three or more movements, essentially similar in construction to a sonata, but written for an orchestra, and usually of far grander proportions and more varied elements. The symphony is now recognized as the highest kind of instrumental music. It was brought to its classical form mainly by Haydn in the last part of the eighteenth century, and has since been extensively developed by Mozart, Beethoven, Mendelssohn, Schumann, Brahms, and others.

Symphoricarpos (sim-fō'ri-kār'pos), *n.* [*NL. (Dillenius, 1732)*, so called in allusion to the clustered berries; *< Gr. συμφορεῖν*, bear together (*< σύν*, together, + *φορεῖν* = *E. bear*), + *καρπός*, fruit.] A genus of gamopetalous shrubs, of the order *Caprifoliaceae* and tribe *Lonicereae*. It is characterized by flowers with a cup-shaped or four- or five-toothed calyx, a funnel- or bell-shaped corolla bearing as many lobes and epipetalous stamens, and an ovary of four cells, two with a few imperfect ovules, the others each with the ovule solitary, perfect, and pendulous. The 8 or 9 species are natives of the United States, Canada, and the mountains of Mexico. They are mainly western; one, *S. occidentalis*, extends north to latitude 64°. They are smooth or hairy shrubs with slender four-angled branchlets and scaly buds, producing opposite ovate leaves which are entire or

obtusely toothed on young plants. The small white or red flowers are arranged in short axillary spikes or in racemes, and are followed by fleshy white or red berries, each with four cells but only two seeds. In several species the corolla is remarkably filled with close white hairs. For the three eastern species, see *coral-berry*, *snowberry*, and *wolfberry*; the first is also known as *Indian currant*, and a general name is *St.-Peter's-wort*.

symphoricarpous (sim'fō-rī-kār'pus), *a.* [*Gr.* *συμφέρειν*, bear together, + *καρπός*, fruit.] In *bot.*, bearing several fruits clustered together.

symphyanthorous (sim-fi-an'thēr-us), *a.* [*Gr.* *συνφύει*, growing together (< *σύν*, together, + *φύειν*, grow), + *NL.* *anthera*, anther, + *-ous*.] In *bot.*, same as *symantherous*.

symphyrcarpous (sim-fī-kār'pus), *a.* [*Gr.* *συμφύει*, growing together, + *καρπός*, fruit.] In *bot.*, having the fruit confluent, as the disks of the apothecia in certain gymnocarpous lichens.

Symphyla (sim-fi-lī), *n. pl.* [*NL.*, (< *Gr.* *σύνφυλος*, of the same stock, < *σύν*, together, + *φύλον*, φύλι, a tribe: see *phylum*).] An order or suborder of insects, combining some characters which are now mostly manifested in widely distinct types. This group is represented by the *Scolopendrellidae*, and forms in some respects a connecting-link between the classes of myriapods and hexapods. All the known species are small (less than 7 millimeters in length); they resemble minute centipeds, and each abdominal segment bears a pair of legs; with the exception of these appendages, however, the structure resembles that of some thysanurous insects. The legs are five-jointed, and end in a pair of claws.

S. H. Scudder, Mem. Acad. Nat. Sci., III. 90.

symphyntote (sim'fi-nōt), *a.* [*Gr.* *συνφύει*, growing together, + *νῶτον*, the back.] Soldered together at the back or hinge, as the valves of some unios, or having valves so soldered, as a unio: the opposite of *asymphyntote*.

In some of the species the valves become soldered together at the hinge, so that motion would be impossible were it not for the fact that a fracture takes place near the line of junction, so that one valve bears two wings and the other none. This fact has been used by Dr. Lea to divide the numerous species of Unio into two groups, those with soldered hinge being called *symphyntote*, and those with the normal structure *asymphyntote*.
Stand. Nat. Hist., I. 270.

symphyogenesis (sim'fi-ō-gen'e-sis), *n.* [*Gr.* *συνφύειν*, grow together, + *γένεσις*, generation; see *genesis*.] In *bot.*, the forming by union of previously separate elements.

symphyostemonous (sim'fi-ō-stem'ō-nus), *a.* [*Gr.* *συνφύειν*, grow together, + *στήμων*, the warp in a loom (in mod. bot. a stamen).] In *bot.*, having the stamens united; monadelphous.

[= *F.* *symphyse*, < *NL.* *symphysis*, < *Gr.* *σύνφυσος*, a growing together, union, < *συνφύειν*, cause to grow together, mid. *συνφύειν*, grow together, < *σύν*, together, + *φύειν*, produce, grow.] 1. In *anat.* and *zool.*: (a) The union or connection of bones in the middle line of the body, either by confluence, by direct apposition, or by the intervention of cartilage or ligament; also, the

part, or configuration of parts, resulting from such union or connection. Symphysis usually constitutes an immovable joint, and may be so intimate that all trace of original separateness of the parts is lost. These two conditions are illustrated in the human body in the symphysis of the pubic bones and of the two halves of the lower jaw respectively; but in many animals symphyses remain freely movable, as in the two halves of the lower jaw of serpents. The term is chiefly restricted to the growing together or close apposition of two halves of a bilaterally symmetrical bone, or of a bone with its synost of the opposite side—other terms, as *ankylosis*, *synostosis*, *synchondrosis*, and *suture*, being applied in other cases. See cuts under *innominatum* and *pelvis*. (b) Some point or line of union between two parts; a commissure; a chiasm: as, the *symphysis* of the optic nerves. (c) Attachment of one part to another; a growing together; insertion or gomphosis with union: as, the *symphysis* of teeth with the jaw. See *acro-dont*, *pleurodont*. (d) Coalescence or growing together of parts so as to close a natural passage; atresia.—2. In *bot.*, a coalescence or growing together of similar parts.—**Ilac**, **ischiatric**, **pubic symphysis**. See the adjectives.—**Mental symphysis**, **symphysis mandibulæ**, **symphysis menti**, the union or apposition of the two halves of the lower jaw-bone; the midline of the chin in man, the gonys or gonydeal line of a bird, etc.—**Symphysis pubis**, the pubic symphysis.

Symphytum (sim'fi-tum), *n.* [*NL.* (Tournefort, 1700), < *L.* *symphyton*, < *Gr.* *σύνφυτον*, plant, comfrey, boneset (so named from its reputed medicinal power), < *συνφύειν*, make to grow together: see *symphysis*.] A genus of gamopetalous plants, of the order *Boraginaceæ*, tribe *Boragææ*, and subtribe *Anchusææ*. It is characterized by a broadly tubular corolla with short somewhat erect lobes, bearing within five scales and five short stamens with linear anthers. About 17 species are known, natives of Europe, northern Africa, and western Asia, and occasionally naturalized elsewhere, as *S. officinale* in the eastern United States. They are commonly rough erect herbs, sometimes with a tuberous root. They bear alternate or mostly radical leaves, the uppermost sometimes nearly opposite. The flowers are blue, purplish, or yellowish, and form parted terminal cymes or simple one-sided racemes. The species, especially *S. officinale* (see cut under *scorpioid*), are known as *comfrey*. *S. tuberosum* with pale-yellow and *S. aspernum* with light-blue flowers are occasionally cultivated for ornament. The latter, the prickly comfrey, is also a forage-plant, said to support large flocks and herds in the Caucasus, its native region. It has excited much interest and to some extent been introduced elsewhere, especially in Australia; it is a hardy plant, yielding heavily, and is relished by cattle after they have become accustomed to it, though commonly refused by them at first.

sympiesometer (sim'pi-e-som'e-tēr), *n.* [*Irreg.* < *Gr.* *συνπιέζειν*, a pressing together (< *συνπιέζειν*, press or squeeze together, < *σύν*, together, + *πιέζειν*, press, squeeze), + *μέτρον*, measure.] 1.

Sympiesometer, 1.

2. A form of barometer in which the pressure of the atmosphere is balanced partly by the weight of a column of liquid and partly by the elastic pressure of a confined mass of gas. As originally constructed by Adie of Edinburgh, it consists of a short inverted siphon-tube, with a bulb blown on the end of the longer leg, while the shorter leg is left open. The bulb and the upper end of the tube are filled with air or hydrogen, and the lower part of the tube with glycerin. The pressure of the atmosphere exerted upon the surface of the liquid is balanced by the pressure of the inclosed gas and by the weight of the column of liquid which is supported. The level of the liquid constitutes the reading of the instrument. At each observation the scale is adjusted for the temperature, and an attached thermometer forms an essential auxiliary. The sympiesometer is more sensitive than the mercurial barometer, but it does not so well maintain its constancy, and its readings cannot be so accurately corrected and evaluated. An improved form of the instrument consists essentially of a cistern-barometer, with air above the column of liquid instead of a vacuum. The measurement consists in determining the height of a column of liquid required to keep the inclosed air compressed into a standard volume. By this method of use the theory of the instrument is

simplified, and the readings are easily evaluated. Also *sympiesometer*.

symplectic (sim-plek'tik), *a.* and *n.* [*Gr.* *συνπλεκτικός*, twining together, < *συνπλέκειν*, twine or weave together, < *σύν*, together, + *πλέκειν*, twine, weave: see *plicate*.] 1. *a.* Placed in or among, or put between, as if ingrained or woven in: specifically noting a bone of the lower jaw of fishes interposed between others.

II. *n.* A bone of the lower jaw or mandibular arch of some vertebrates, as fishes, between the hyomandibular bone above and the quadrate bone below, forming an inferior ossification of the suspensorium of the lower jaw, articulated or ankylosed with the quadrate or its representative. Also called *mesotympanic*. See cuts under *palatoquadrate* and *teostat*.

symplesite (sim'ple-sit), *n.* [So called in allusion to its relation to the other minerals named; < *Gr.* *σύν*, together, + *πλησιάζειν*, bring near, mid. come near (< *πλησιος*, near), + *-ite*.] A mineral occurring in monoclinic crystals and crystalline aggregates. It is an arseniate of ferrous iron, belonging in the group with vivianite and erythrite.

Symplocarpææ (sim-plō-kār'pē-ē), *n. pl.* [*NL.* (A. Engler, 1879), < *Symplocarpus* + *-ææ*.] A subtribe of plants, of the order *Araceæ* and tribe *Monsteroideæ*. It is marked by a subterranean rootstock, by leaves distichous when young, spiral when mature, by bisexual flowers, and seeds with a large embryo without albumen. It consists of three singular monotypic and mostly American genera, of which the largest, *Lycichiton*, occurring in California, Alaska, Siberia, and Japan, produces elliptical leaves reaching 3 feet in length; for the others, see *Orontium* and *Symplocarpus*.

Symplocarpus (sim-plō-kār'pus), *n.* [*NL.* (Salisbury, 1818), so called with ref. to the union of the ovaries into a multiple fruit; short for **symplococarpus*, < *Gr.* *σύνπλοκος*, interwoven (see *symplocæ*), + *καρπός*, fruit.] A genus of plants, of the order *Araceæ*, type of the subtribe *Symplocarpææ*; the skunk-cabbage. It is characterized by a globose, arching, and hooded persistent spathe containing fertile bisexual flowers crowded on a nearly globular spadix, each with four perianth-segments, four stamens, and a thick four-angled style crowning an ovary with a single cell and ovule or with a second empty cell. The only species, *S. foetidus*, is a native of America, northeastern Asia, and Japan, common in bogs and moist places in the eastern or central United States from Iowa to North Carolina and in Nova Scotia. It is a robust herb with a thick descending rootstock, producing a crown of large ovate and heart-shaped coriaceous leaves. The streaked or mottled spathe rises a few inches above the ground, and incloses a comparatively small brownish spongy spadix, which ripens into a globose syncarp of berries, each with a single large rounded seed filled with a solid fleshy embryo. From the very large broad leaves, and from its odor when bruised, the plant is known as *skunk-cabbage* (which see, under *cabbage*). See also *dracontium*, 2.

symploce (sim'plō-sē), *n.* [*Gr.* *σύνπλοκος*, an interweaving, interlacing (cf. *σύνπλοκος*, interwoven), < *συνπλέκειν*, weave together: see *symplectic*.] In *rhet.*, the repetition of one word at the beginning and another at the end of successive clauses, as in the sentence "*Mercy descended from heaven to dwell on the earth; Mercy fled back to heaven and left the earth.*" This figure is a combination of epanaphora and epistrophe (whence the name). Also, incorrectly, *simploce*.

Take me the two former figures (anaphora and antistrophe) and put them into one, and it is that which the Greeks call *symploche*, . . . and is a manner of repetition.
Puttenham, Arte of Eng. Poesie, p. 166.

symplocium (sim-plō'si-um), *n.* [*NL.*: see *symploce*.] In *bot.*, the annulus in the sporangium of ferns.

Symplocos (sim'plō-kos), *n.* [*NL.* (J. F. Jacquin, 1763), named from the stamens, which are highly monadelphous in some species; < *Gr.* *σύνπλοκος*, interwoven: see *symploce*.] A genus of gamopetalous plants, of the order *Styracææ*. It is characterized by flowers having numerous stamens with short anthers and in many rows, and a two- to five-celled ovary containing two or rarely four pendulous ovules in each cell, and ripening into a fleshy indehiscent fruit crowned with the calyx-lobes, and filled by a single oblong seed having a terete embryo, long radicle, and short cotyledons. There are about 165 species, natives of warmer parts of Asia, Australia, and America, but not known in Africa. They are trees or shrubs, often smooth, and turning yellowish in drying. They bear alternate toothed or entire leaves, and axillary racemes or spikes, sometimes reduced to a single flower. The fruit is an oblong or roundish berry or drupe. Several species, with yellow, red, or white flowers, are occasionally cultivated.

For *S. tinctoria*, the only species in the United States, see *seeberry*. The bark and leaves of this and several other species, particularly of *S. racemosa*, the lodh-bark tree of India are used as a dye. The leaves of *S. ramossima* of the Himalayas are said to be there the food of the yellow silkworm. All contain an astringent principle in their leaves. The leaves of *S. Alstonia* (*Alstonia theaeformis*), a branching South American shrub, are used as a substitute for tea in Brazil.

Thus in a dichotomy branching only one of the secondary axes may develop strongly, the weaker branch appearing as a small lateral shoot from its base; and an apparent primary shoot is thus produced which in reality consists of the bases of single branches of consecutive forking. Such an axis is termed a *pseudaxis* or *sympodium*. *Encyc. Brit.*, IV. 93.

sympolar (sim-pō'lār), *a.* [*< Gr. σῦν*, with, + *E. polar*.] Polar to one another. **Sympolar pair** of heteropolars, a pair of polyhedra such that to each face of the one corresponds a summit of the other, and vice versa.

The symposium usually followed a dinner, for the Greeks did not drink at meals. Its enjoyment was heightened by intellectual or agreeable conversation, by the introduction of music or dancers, and by other amusements. The beverage was usually wine diluted with water, seldom pure wine.

In these *symposia* the pleasures of the table were improved by lively and liberal conversation. *Gibbon, Misc. Works*, I. 115.

The reader's humble servant was older than most of the party assembled at this *symposium* (Philip's call-supper). *Thackeray, Philip*, vii.

L. synagoga*, *< Gr. συναγωγή*, a bringing together, a collecting, collection, in LXX and N. T. an assembly, synagogue, *< συναγέρω*, gather or bring together, *< σῦν*, together, + *ἀγείω*, drive, lead: see *agent*.] **1.** An organization of the Jews for the purposes of religious instruction and worship.

The term *synagogue* (like our word church) signifies first the congregation, then also the building where the congregation meet for public worship.

Schaff, Hist. Christ. Church, I. § 51.

2. The building where such instruction and worship are maintained. The synagogue first came into prominence in the religious life of the Jewish people during the exile, and, since the destruction of the temple and the dispersion of the Jews, constitutes their customary place of worship. The organization of the synagogue consists of a board of elders presided over by a ruler of the synagogue (Luke viii. 41, 49, xiii. 14). The worship is conducted according to a prescribed ritual, in which the reading of the Scripture constitutes a prominent part. Formerly the officers of the synagogue exercised certain judicial functions, and the synagogue itself was the place of trial (Luke xii. 11, xxi. 12), but this is no longer the case.

There besyde was the *Synagoge*, where the Bysshoppes of Jewes and the Pharysees camen to gidere, and helden here Conseille. Mandeville, Travels, p. 93.

3. An assembly of Jewish Christians in the early church.

If there come into your *synagogue* a man with a gold ring, in fine clothing, . . . and ye have regard to him that weareth the fine clothing, . . . are ye not . . . become judges with evil thoughts? Jas. ii. 2 [R. V.].

Hence—4. Any assembly of men. [Rare.]

The jarring late between the houses,
But by your party *synagoguish*,
Not half so politic as roughish?

D'Urfey, Colin's Walk, i. (Davies.)

synalephe, synalœphe (sin-a-lē'fē), *n.* [= *F. synalœphe*, *< L. synalœphe*, *< Gr. συναλοιφή*, the contraction of two syllables into one, *< συναλείφειν*, smear together, smooth over, unite, *< σύν*, together, + *αλείφειν*, anoint.] The blending of two successive vowels so as to unite them in one syllable, as by syneresis, synizesis, crasis, so-called elision, or a combination of these; especially, the obscuration or suppression of a final vowel-sound (vowel or diphthong) before an initial vowel-sound, as in *th' enemy* for *the enemy*. Usually, as in the instance just given, the final vowel is only obscured, not suppressed, being audible. When the final vowel is entirely suppressed, as in French *l'amî* for *le ami*, there is no longer a true blending or synalephe, but the term has been extended to include such cases. What is commonly called *elision* is usually synalephe or blending, not ecclipsis or suppression.

I have named the *synalepha*, which is the cutting off one vowel immediately before another.

Dryden, Third Miscellany, Ded.

See *syncretist*. This word first passed into common use at the Reformation, and was then used indifferently, in both a good and a bad sense, to designate the attempted union of different sects on the basis of tenets common to all. It soon lost all but its contemptuous meaning, and became specifically restricted to the system of a school of thinkers within the Lutheran Church.

The word has somewhat varied application to certain embryonic formations and to some adult tissues, as striped muscular fiber, certain parts of sponges, etc.

The ectoderm [of a calcareous sponge] is a transparent, slightly granular, gelatinous mass in which the nuclei are scattered, but which, in the unaltered state, shows no trace of the primitive distinctness of the cells which contain these nuclei, and is therefore termed by Haeckel a *syncytium*. *Huxley, Anat. Invert.*, p. 103.

It includes Neotropical arboreal prehensile-tailed porcupines, closely related to *Sphingurus*, but differing in the broad and highly arched frontal region, and the greater development of spines. The name was proposed by F. Cuvier in 1822, when he divided the American porcupines into *Erethizon*, *Synetheres*, and *Sphingurus*. *Cercolabes* is a synonym.

Synetherinae (si-neth-'e-rī-nē), *n. pl.* [NL., < *Synetheres* + *-inae*.] A subfamily of *Hystriidae*, typified by the genus *Synetheres*, having the

tail prehensile and all four feet four-toed; so named after *Syntherisma* of Gervais, 1852) by J. A. Allen in 1877. Also called *Sphingurina* and *Cercolabina*.

Syngenesia (sin-je-nē'si-ā), *n. pl.* [NL., < Gr. *σύν*, together, + *γένεσις*, generation. Cf. *syngensis*.] The nineteenth class of plants in the sexual system of Linnæus, the *Compositæ* of the natural system, the name alluding to their united anthers, which thence are now called *syngeneses*. There are, according to him, 6 orders, namely *Polygamia aqualia*, *Polygamia superflua*, *Polygamia frutranca*, *Polygamia necessaria*, *Polygamia segregata*, and *Monogamia*. The thistle, tansy, daisy, southernwood, sunflower, and marigold are examples. See *Compositæ*, and cut under *stamen*.

syngensis (sin-je-nē'sis), *n.* [NL., < Gr. *σύν*, together, + *γένεσις*, generation.]

Reproduction in which a male and a female take part, one furnishing spermatozoa and the other an ovum, so that the substance of the embryo is actually derived from both parents. This is the rule, perhaps without exception, in sexual generation, and opposes the view of the spermists, that the embryo comes from the male element, for the development of which the female furnishes only the nidus, and that of the ovulists, that the embryo is derived entirely from the female, the male principle affording only the requisite stimulus to development. As a doctrine or theory, one form of syngensis supposes every germ to contain the germs of all generations to come, and is opposed to *epigenesis*.

The theory of *syngensis*, which considers the embryo to be the product of both male and female, is as old as Empedocles.

Growth, therefore, was, on this hypothesis (of Buffon's), a process partly of simple evolution, and partly of what has been termed *syngensis*. Huxley, *Evol. in Biol.*

syngenetic (sin-jē-net'ik), *a.* [*Syngensis*, after *genetic*.] — Produced by means of both parents, male and female; of or pertaining to syngensis: as, a *syngenetic* process; a *syngenetic* theory.

It is found in cavities in rock-salt at Kalusz in Galicia, Austria-Hungary. Also called *bitusite*.

branch fishes having a fistulous snout and no ventral fins, as the pipe-fishes, sea-horses, and related forms. See *Hippocampidae*, *Syngnathidae*.

Syngnathidae (sing-nath'i-dē), *n. pl.* [NL., < *Syngnathus* + *-idae*.] A family of lophobranchiate fishes, typified by the genus *Syngnathus*, to which different limits have been assigned. (a) In the earlier systems, including the sea-horses or *Hippocampidae* with the true *Syngnathidae*. It originally included all the species of the modern families *Syngnathidae* and *Hippocampidae*, but it is now restricted to about 30 species of the former family. See cut under *pipe-fish*.

(Schott, 1829), so called from the united fruit; < Gr. *σύν*, together, born together, cognate, < *σύν*, together, + *γενέσθαι*, be born.] A genus of monocotyledonous plants, of the order *Araceæ*, type of the subtribe *Syngonieæ*. It is characterized by a climbing shrubby stem, stamens connate into a prismatic body, and coherent ovaries with anatropous basilar ovules solitary in their one or two cells. The fruit is a mucilaginous syncarp, composed of coalescent berries with black obovoid seeds without albumen, and mainly composed of the large embryo. There are about 10 species, natives of tropical America, from the West Indies and Mexico to Brazil. They are irregular climbers, rooting at the nodes, and there bearing long-stalked leaves, the earlier arrow-shaped, the later three- to nine-divided. The flowers are produced on a monocious spadix, the staminate part club-shaped and much longer, borne in a still longer spathe, which consists of an ovoid persistent tube and a shell-shaped, finally reflexed, and deciduous upper section. *S. auritum*, long cultivated under the name *Caladium*, is known in Jamaica as *fivefinger*, from its five-parted leaves.

An assembly of ecclesiastics or other church delegates duly convoked, pursuant to the law of the church, for the discussion and decision of ecclesiastical affairs; an ecclesiastical council. Synods or councils are of five kinds — ecumenical, general, national, provincial, and diocesan. For definition of their several characteristics, see *council*, 1.

Why should you have a *Synod*, when you have a Convocation already, which is a *Synod*?

Selden, *Table-Talk*, p. 108.

Twice a year, in accordance with the canonical institutions of Christian antiquity, had it been ordered of old in an English Council that every bishop and his priests should meet together in *synod*; the common form of proceeding which was used in these early clerical gemotes is believed to be still extant. R. W. Dixon, *Hist. Church of Eng.*, xix.

They [the bishops] had large estates which they held of the king, seats in the national council, preeminence in the national *synod*, and places in the general councils of the church. Stubbs, *Const. Hist.*, § 378.

Specifically — 2. In Presbyterian churches, the court which ranks above the presbytery, and either is subordinate to a general assembly (as in most of the larger denominations) or is itself the supreme court of the church. In the former case the presbyteries of the whole church are grouped into synods, each of which comprises all the parishes or congregations of a particular district. The members of the synod are in most cases the members of all the presbyteries within its bounds; but in some churches the synod is composed of delegates from the presbyteries.

3. A meeting, convention, or council.

In *synod* unbeneign.

Milton, *P. L.*, x. 661.

Holy Governing Synod (of all the Russias), a synod which is the highest ecclesiastical authority in the Russian Church. It consists of several metropolitans and other prelates and officials — the chief procurator for the synod representing the czar. It was instituted by Peter the Great in 1721, to supply the place of the patriarch of Moscow. The last patriarch had died about 1700, and Peter would not allow the appointment of a successor,

thinking the power of the patriarchal office too great. The orthodox national church of the kingdom of Greece is also governed by a synod of archbishops and bishops, independent of any patriarch.—**Mixed synod**, a synod composed of clergy and laity.—**Robber synod**. Same as *Latrocinium*, 2.

R. W. Dixon, Hist. Church of Eng., xxi.

2. In *astron.*, pertaining to a conjunction or two successive conjunctions of the heavenly bodies.

2. A word of one language which corresponds in meaning with a word in another language. See *heteronym*, 2, *paronym*, 2, and the quotation from Camden under *synonymize*.—*3.* In *nat. hist.*, a systematic name having the same, or approximately the same, meaning or application as another which has superseded it; a technical name which, by the rules of nomenclature, is not tenable. The question of the acceptance of a generic or a specific name depends upon the law of priority. (a) Botanists take 1753, the year of the publication of Linnæus's "Genera Plantarum," as the starting-point for genera, and 1753, the year of publication of Linnæus's "Systema Naturæ," as the starting-point for species, since in this publication binomials were for the first time systematically adopted. The naming of a botanical species consists in conferring upon it two appellations, a generic and a specific; and adequate publication consists in issuing a printed diagnosis sufficient to identify the plant with certainty. The earliest name conferred after the above dates is the name by which, according to the law of priority, the plant must be known, providing, of course, that the classification is correct; and it is held that a strict adherence to this rule is essential in order to a stable systematic nomenclature. Since plants have often been placed in a wrong genus, the question arises whether the absolutely first specific name is to be retained, or the first that was used with the right genus name; the former is the accepted alternative. The names thus discarded are called *synonyms*, though in a broader sense all the names from which the selection is made are *synonyms*. On account of unsettled usage synonyms must often be quoted. In obedience to the law of priority, Nuttall's name *Carya*, by which the hickory has been known since 1818, becomes a synonym of *Hicoria*, the earlier name of Rafinesque;

Nymphaea gives way to *Castalia*; *Adlonia cirrhosa* of Rafinesque to *Adlonia fungosa* of Aiton; *Trochilus Americanus* of Muhlenberg to *T. latus* of Salisbury; etc. (b) Zoologists usually adopt a different date as the starting-point. In England and on the continent of Europe this is generally 1766, the date of the twelfth edition of the "Systema Naturæ" (with an express exception in favor of the genera (not the species) of Brisson, 1760); American zoologists nearly all start from 1758, the date of the tenth edition of the work named. This difference of dates is the chief incompatibility of two schools which have become known as the *English* and the *American*, neither of which has thus far yielded the point to the other. The former school contends that 1766 (the date of the last edition of the "Systema," revised by the author himself) represents the completion of the Linnean binomial system in zoology, the earlier editions having been but provisional or tentative; the latter school maintains that 1758 is the date when that system was first formally and consistently applied to zoology. In practice the whole matter of synonyms is extremely complicated by various considerations other than the single question of priority in any given case—as, for example, the adequacy or exclusive pertinence of the diagnosis upon which a name rests; recognizability of a description; acceptance of a name in a wide or a narrow sense by different authors; transference or cross-use of a name by different authors; erroneous identification and consequent wrong applications of a name; rejection of a name for one of several different reasons and introduction of another name in its stead; the question whether use of a name in botany precludes its subsequent use in zoology (and conversely); the question whether the same name can be an onym in more than one of the numerically enormous orders of insects; and, particularly, the biological question (a matter necessarily of expert opinion) of what constitutes a genus, species, subspecies, etc. To all the above considerations (besides which various others could be added) is to be added especially, in accounting for the vast number of synonyms which encumber zoological nomenclature, the incessant redescription and renaming of species and genera in ignorance of the fact (or ignoring the fact) that they had been named before, or mistaking them for valid when they are not. One singular class of synonyms is merely verbal, arising from corrections of malformed words, which, when properly respelled, are seen to be literally identical with other names from which they had appeared different by the misspelling; and with this class of synonyms is related another, arising from a mere difference in termination (as of gender, for example, *Picus* and *Pica*), inflection, etc. (as *Synodus*, *Synodon*, *Synodontus*, *Synodontis*). Literal quibbles of this sort have proved so frequently vexatious that the American school has declared that a word must subsist precisely as originally printed, no matter how malformed or misspelled, unless a typographical error be manifest, and that any two words which are differently spelled are tenable as different names, if the distinction be anything more or other than mere change of termination (as *-us*, *-a*, *-um*, or *-ites* and *-itis*, as distinguishing grammatical gender). Irrespective of the law of priority, and also of any such moot points as are above cited, the rules of nomenclature require (1) that no specific or subspecific name shall be used twice in the same genus; and (2) that no generic name, or name of any higher group, shall be used twice in the animal kingdom. There is thus, theoretically, but a single onym (tenable binomial designation) of every species, and a single onym of every genus or higher group—all other designations being in every case synonyms. Practically, however, the case is far from any such simplicity and uniformity; alternative technical names incessantly recur in the literature of zoology; and the synonymy of numberless species, genera, etc., is in almost inextricable confusion. The number of synonyms in zoology vastly exceeds that of theonyms; most species which have long been known have acquired a larger number of New Latin synonyms than of English names; very many have been placed in a dozen or more different genera, and have been described under as many different specific names—the various combinations of which generic and specific designations are a third source of uncounted synonyms. Such uncertainty and inconvenience have resulted from all these nomenclatorial vagaries that some zoologists do not hesitate to ignore the fundamental law of priority, and continue to call a species by the technical name by which it has been oftenest called already. Such consensus of the nomenclators has at least the advantage of presenting better-known instead of less-known names.

synonymally (si-non'i-mäl-i), *adv.* Synonymously.

synonymatic (si-non'i-mät'ik), *a.* [*< synonym + -atic².*] Same as *synonymic* or *synonymical*, being a purer form of these words, now more frequently employed by naturalists. The word differs in use from *synonymous*; we speak of a *synonymatic* list of words (as the several synonyms of a plant or an animal), but say of the synonyms themselves that they are *synonymous*.

synonyme, *n.* See *synonym*.

synonymic (sin'ō-nim'ik), *a.* [= *F. synonymique*; as *synonym + -ic.*] *1.* Synonymous.—*2.* Of or pertaining to synonyms.

intermaxillaries; and the supramaxillaries are rudimentary or absent. The dorsal fin is short and submedian, the anal moderate, the pectorals are well developed, and the ventrals, also well developed, are not far behind the pectorals. synonymity (sin-ō-nim'i-ti), *n.* [*< synonym + -ity*.] The state of being synonymous; synonymy.

To found any harmonic theories on the *synonymity* of tones in any temperament, when there is known to be no *synonymity* in nature, and when the artificial *synonymity* thus engendered varies from temperament to temperament, is only comparable to deducing geometrical conclusions from the mere practical construction of figures.

Ellis, in Helmholtz's Sensations of Tone, App., p. 660.

synonymize (si-non'i-miz), *v. t.*; pret. and pp. *synonymized*, ppr. *synonymizing*. [*< synonym + -ize*.] To express by words of the same meaning; express the meaning of by an equivalent in the same or another language. Also spelled *synonymise*.

Selden, Illustrations of Drayton's Polyolbion, ii.

4. A system of synonyms; a collection of synonyms; also, the study of synonyms; the use of synonyms in expressing different shades of meaning; the discrimination of synonyms; especially, in *nat. hist.*, the sifting of synonyms to determine the *onymus*. In botany and zoology the synonymy of a species of plant or animal, in the concrete, is a list of the several different names which have been applied to it by its various describers or classifiers, implying on the synonymist's part the discrimination not only of the synonyms of the species, but of the homonyms of related species, for the especial purpose of determining the *onymus* of each species. Thus, *Falco fuscus* and *Falco obscurus* may be synonyms of one and the same species of falcon, yet *Falco fuscus* may be a homonym of two different species of falcon, and it may be that neither name is the *onymus* of either of these species. Synonymy in natural history has become of late years so extensive and so intricate that probably no naturalist has mastered the subject beyond the line of some one narrow speciality. Synonymic lists for single species extending over several pages of an ordinary book are of no infrequent occurrence.

See synonymy.

The inconveniences arising from the want of a good nomenclature were long felt in Botany, and are still felt in Mineralogy. The attempts to remedy them by *Synonymies* are very ineffective, for such comparisons of synonyms do not supply a systematic nomenclature.

II. *n.* One of the synoptic gospels; also, one of the writers of the synoptic gospels; a synoptist.

Yet the Tübingen professors and our Liberal newspapers must surely have something to go upon when they declare that the Jesus of the Fourth Gospel speaks quite differently from the Jesus of the *Synoptics*, and propound their theory of the Gnostic philosopher inventing, with profoundly calculated art, his fancy Gospel.

M. Arnold, God and the Bible, vi. § 5.

The real difference between John and the *Synoptics*, on this most decisive point, amounts to this: while these last have handed down to us but a single example of this form of language, John has preserved for us several examples selected with a particular purpose.

synoptical (si-nop'ti-kal), *a.* [*< synoptic + -al*.] Same as *synoptic*.—**Synoptical table**, in *nat. hist.*, a tabular synopsis of the leading, generally the most striking or easily recognized, characters of any group in zoology or botany, whereby the group is exhibited with a view to the ready identification of a given specimen, or analyzed to illustrate the relationship of its several components to one another. Such tables often proceed upon the dichotomous plan of presenting in succession alternatives of two (or more) characters, only one of which the specimen in hand should exhibit, as the "ovary inferior" and "ovary superior" in case of a plant; but the tabulation may be made in any way which best subserves the desired purpose in different cases. Some are natural analyses, others wholly artificial; the former are the more important and really instructive, the latter the most convenient and immediately helpful. Some combine these incompatible features as far as possible; and all are constantly used in systematic treatises, manuals, and text-books. They are often called *keys*.

A putting of two or more things together; composition; specifically, the combination of separate elements or objects of thought into a whole, as of simple into compound or complex conceptions, and individual propositions into a system; also, a process of reasoning advancing in a direct manner from principles established or assumed, and propositions already proved, to the conclusion: the opposite of *analysis*.

It [speech] should carry an orderly and good construction, which they called *Synthesis*.

Puttenham, Arte of Eng. Poesie, p. 130.

Geometrical deduction (and deduction in general) is called *synthesis*, because we introduce, at successive steps, the results of new principles. But in reasoning on the relations of space we sometimes go on separating truths into their component truths, and these into other component truths, and so on; and this is geometrical analysis. *Whewell, Philos. of Inductive Sciences, II. xxiii.*

2. Specifically—(a) In *gram.*, the combination of radical and formative elements into one word, as distinguished from their maintenance in the condition of separate words. *See synthetic*. 2. (b) In *surg.*, an operation by which divided parts are united. (c) In *chem.*, the uniting of elements into a compound; composition or combination: the opposite of *analysis*, which is the separation of a compound into its constituent parts: as, that water is composed of oxygen and hydrogen is proved both by analysis and by *synthesis*. (d) In *acoustics*, the combining of two or more simple sounds of different pitch, as those of several tuning-forks to produce or imitate a certain compound sound, as, for example, that of a piano-string.—**Dynamic, pure, etc., synthesis.** *See the adjectives.*—**Synthesis of apprehension.** *See apprehension.*—**Synthesis of reproduction.** *See reproduction.*

synthesise, *v. t.* *See synthesise.*

synthesist (sin'the-sist), *n.* [*Gr. synthes-is + -ist*.] One who employs synthesis, or who follows synthetic methods. *Compare syntheticist.*

Science turns her back on the subject, and the universities dismiss Art from the category of studies, and pass it over mainly to the painters to discourse on, ignoring the psychological law that no mind can be productively analytical and synthetical at the same time, and the artist, being perforce a *synthesist*, cannot be expected to analyse the art which he is, if a true artist, occupied in building. *New Princeton Rev., II. 24.*

synthesize (sin'the-siz), *v. t.*; pret. and pp. *synthesized*, ppr. *synthesizing*. [*Gr. synthes-is + -ize*.] To combine or bring together, as two or more things; unite in one; treat synthetically. Also spelled *synthesise*.

The functions of separate organs are subsumed and *synthesized* into the activity of a yet higher unity—that of the organic system to which they belong. *Mivart, Nature and Thought, p. 187.*

synthetic (sin-thet'ik), *a.* [= *F. synthétique = Sp. sintético = Pg. sintetico = It. sintetico*, *< NL. syntheticus*, *< Gr. συνθετικός*, skilled in putting together or in composition, *< συνθῆναι*, put together: see *thesis*.] 1. Of or pertaining to synthesis; consisting in synthesis: as, the *synthetic* method of reasoning, as opposed to the *analytical*.

In fact, all mathematical judgments are *synthetic*, or, if analytic judgments are made in mathematics, they are quite subordinate in importance.

E. Caird, Philos. of Kant, p. 211.

That activity which we variously call "poetic," "imaginative," or "creative" is essentially *synthetic*, is a process of putting together, while the scientific process seems distinctively analytic, or a tearing apart. *S. Lanier, English Novel, p. 69.*

2. In *gram.*, characterized by synthesis, or the combination of radical and formative elements into one word, as distinguished from their maintenance in separate words, which is *analytic*. Thus, *man's* is *synthetic*, of *man* is *analytic*; *higher* is *synthetic*, *more high* is *analytic*; *loved* is *synthetic*, *did love* is *analytic*; and so *amabatur* (Latin) and *will be loved*. The

epithet is used both of single formations, like these, and of classes of expressions; also of a whole language, or a period or class of languages, according as expressions of one or of the other class prevail in each case.

3. In *biol.*, of a general or comprehensive type of structure; combining in one organism characters which are to be specialized in several different organisms in the course of evolution; generalized, not specialized; undifferentiated. Thus, the *Symphyla* is a synthetic type, as combining characters of the classes *Myriapoda* and *Hexapoda*. Since the general course of evolution is from general to particular, or from generalization to specialization, synthetic forms are mostly low or primitive, and less fully illustrated by recent or living than by early and extinct organisms. Most fossil types are synthetic in comparison with existent forms of which they are ancestral.—**Synthetic geometry**, geometry treated without algebra, or at least without coordinates: opposed to *analytical geometry*. Modern synthetic geometry, which has been almost altogether the fruit of the nineteenth century, resembles the geometry of the Greeks, but far surpasses it in power and beauty. *See geometry.*—**Synthetic judgment or proposition**, a judgment professing to contain matter of fact, and not mere explication of what is implicitly contained in the idea of the subject.—**Synthetic method.** *See method.*—**Synthetic philosophy**, the philosophy of Herbert Spencer: so called by himself, because it is conceived as a fusion of the different sciences into a whole. *See Spencerianism.*

synthetical (sin-thet'i-kal), *a.* [*Gr. synthetic + -al.*] Same as *synthetic*.

Before we have done, we shall see how all-efficient the *synthetical* principle proves to be. No wonder, for it is nothing less than our whole feeling, thinking, and willing subject; in fact, our very being mentally occupied.

E. Montgomery, Mind, No. 35, July, 1884.

The composition of water may be demonstrated by synthesis. . . . The discovery of the composition of water was indeed made originally by *synthetical*, and not by analytical processes. *Huxley, Physiology, vii.*

Accidental synthetic mark. *See mark* 1.—**Synthetic cognition, definition, etc.** *See the nouns.*

1. A portable hydraulic instrument of the pump kind, commonly employed to draw in a quantity of water or other fluid, and to squirt or eject it forcibly. In its simplest form it consists of a small cylindrical tube with an air-tight piston fitted with a rod and handle. The lower end of the cylinder terminates in a small tube; on this being immersed in any fluid, and the piston then drawn up, the fluid is forced into the body of the cylinder by the atmospheric pressure, and by pushing back the piston to the bottom of the cylinder the contained fluid is expelled in a small jet. The syringe is used by surgeons and others for washing wounds, for injecting fluids into the body, and for other purposes. A larger form is used for watering plants, trees, etc. The syringe is also used as a pneumatic machine for condensing or exhausting the air in a close vessel, but for this purpose two valves are necessary.

C. O. Müller, *Manual of Archæol.* (trans.), § 227.

3. In *anat.*, the Eustachian tube.—4. In *ornith.*, the voice-organ of birds; the lower larynx, situated at or near the bifurcation of the trachea into the bronchi, and serving to modulate the voice, as in singing. This is usually a more complicated structure than the larynx proper (at the top of the trachea), and so differently constructed in different birds that it affords characters of great significance in classification. The highest group of *Passeres* (namely, the suborder *Oscines*, which contains the singing birds) is signalized by the elaboration of this musical organ, especially with reference to its intrinsic musculature. A few birds have no syrinx; some have one, yet without intrinsic muscles; in some the syringes are wholly bronchial, and consequently paired; in others the syrinx is wholly tracheal, and single. But in nearly all birds the syrinx is bronchotracheal, and results from a special modification of the lower end of the trachea and upper end of each bronchus. The lowermost tracheal ring, or a piece composed of several such rings, is enlarged and otherwise modified, and crossed by a bolt-bar (see cut under *pessulus*), which separates the single tracheal tube into right and left openings of the bronchi. A median septum rises from the pessulus into the trachea, between the two bronchial orifices, and the free upper margin of this septum, called the *semilunar membrane*, forms the inner lip of a rimasyrinx, whose outer lip is a fold of mucous membrane from the opposite side of each bronchus. These membranes are vibratile in the act of singing, and constitute vocal cords. Several upper bronchial half-rings, enlarged and otherwise modified, are completed in circumference by a single continuous membrane, the *internal tympaniform membrane*, which is attached to the pessulus above. The syrinx is actuated by a pair, or several pairs, of intrinsic singing-muscles, called *syringomya*, which vary much in different birds in their attachments as well as in their number. (See *song-muscle*.) In the *Oscines* at least five pairs are recognized, though their nomenclature is by no means settled, owing to their description under different names by different authors, and to the difficulty of homologizing the individual muscles under their many modifications in different birds. The insertion of the syringomya into the ends and not into the middle of the bronchial half-rings is characteristic of the true *Oscines*. See *Acromyoditi*, *Mesomyoditi*.

In Crete the expense was met from the public revenues, in Sparta by a contribution levied upon the heads of families. The food was until the decadence in general plain and sobriety of drinking was enforced. The chief object of the syssitia was to unite the members of the ruling class by bonds of intimacy, and to give them a cohesion which furthered greatly their civil and military enterprise.

systatic (sis-tal'tik), *a.* [= *F. systaltique*, *< LL. systalticus*, *< Gr. συσταλτικός*, drawing together, constraining, *< συσταλίζω*, draw together, restrain, *< συ*, together, + *στέλλω*, set, place, Cf. *peristaltic*.] Alternately contracting and

Any combination or assemblage of things adjusted as a regular and connected whole; a number of things or parts so connected as to make one complex whole; things connected according to a scheme; as, a *system* of canals for irrigation; a *system* of pulleys; a *system* of railroads; a mountain *system*; hence, more specifically, a number of heavenly bodies connected together and acting on each other according to certain laws: as, the solar *system*; the *system* of Jupiter and his satellites.

Who sees with equal eye, as God of all,

A hero perish or a sparrow fall,

Atoms or *systems* into ruin hurled,

And now a bubble burst, and now a world.

Pope, Essay on Man, i, 89.

Every work, both of nature and art, is a *system*; and, as every particular thing, both natural and artificial, is for some use or purpose out of and beyond itself, one may add to what has already been brought into the idea of a *system* its conduciveness to this one or more ends. See *instance* in a watch.

Butler, Analogy.

A Natural *System* is one which attempts to make all the divisions natural, the widest as well as the narrowest, and therefore applies no characters peremptorily. . . . An Artificial *System* is one in which the smaller groups (the Genera) are natural, and in which the wider divisions (Classes, Orders) are constructed by the peremptory application of selected Characters (selected, however, so as not to break up the smaller groups).

Whewell, Philos. of Inductive Sciences, I, p. xxxii.

For a *system*, in the most proper and philosophic sense of the word, is a complete and absolute whole.

H. Bushnell, Nature and the Supernatural, ii.

Star and *system* rolling past.

Tennyson, In Memoriam, Conclusion.

2. A plan or scheme according to which ideas or things are connected into a whole; a regular union of principles or facts forming one entire whole; an assemblage of facts, or of principles and conclusions, scientifically arranged, or disposed according to certain mutual relations so as to form a complete whole; a connected view of all the truths or principles of some department of knowledge or action: as, a *system* of philosophy; a *system* of government; a *system* of education; a *system* of divinity; a *system* of botany or of chemistry; a *system* of railroading; often equivalent to *method*.

There ought to be a *system* of manners in every nation which a well-formed mind would be disposed to relish.

Burke, Rev. in France.

In the modern *system* of war, nations the most wealthy are obliged to have recourse to large loans.

A. Hamilton, The Federalist, No. 30.

There was no part of the whole *system* of Government with which they [the Houses of Parliament] had not power to interfere by advice equivalent to command.

Macleay, Sir William Temple.

I am deeply convinced that among us all *systems*, whether religious or political, which rest on a principle of absolutism, must of necessity be, not indeed tyrannical, but feeble and ineffective *systems*.

Gloucester, Might of Right, p. 102.

3. The scheme of all created things considered as one whole; the universe.—4. Regular method or order; plan: as, to have no *system* in one's business or study.—5. In *astron.*, any hypothesis or theory of the disposition and arrangements of the heavenly bodies by which their phenomena, their motions, changes, etc., are explained: as, the Ptolemaic *system*; the Copernican *system*; a *system* of the universe, or of the world.—6. In the *fine arts*, a collection of the rules and principles upon which an artist works.—7. *Id.* In *Byzantine music*, an interval conceived of as compounded of two lesser in-

tervals, as an octave or a tetrachord. (b) In *medieval and modern music*, a series of tones arranged and classified for artistic use, like a mode or scale. (c) In *modern musical notation*, two or more staves braced together for concerted music.—8. In *anc. pros.*, a group of two or more periods; by extension, a single period of more than two or three cola; a hypermetron. A system the metrical form of which is repeated once or often in the course of a poem is called a *strophe*.

9. In *biol.*: (a) An assemblage of parts or organs of the same or similar tissues. The principal systems of the body in this sense are the *nervous*, both cerebrospinal and sympathetic; the *muscular*, both voluntary and involuntary; the *osseous*, including the cartilages as well as the bones of the skeleton; the *vascular*, including the blood-vascular and lymphatic, or absorbent; the *tegumentary*; the *mucous*, including the mucous membranes; and the *serous*, including the serous membranes. These systems may be subdivided, as the vascular into the blood-vascular and lymphatic systems; or some of them may be grouped together, as when the *connective-tissue* system includes the bones, cartilages, ligaments, tendons, and general areolar or cellular tissues of the body. Hence—(b) In a wider sense, a concurrence of parts or organs in some function. Most if not all such systems act physiologically by the concurrence of several other lesser systems: as, the *digestive* system; the *respiratory* system; the *reproductive* system. Hence—(c) In the widest sense, the entire body as a physiological unity or anatomical whole: as, to take food into the *system*; to have one's *system* out of order. (d) In *ascidology*, the cenobium of those compound tunicates which have a common cloaca, as the *Botryllidae*. *Von Drasche, 1883*.—10. One of the larger divisions of the geological series: as, the Devonian *system*; the Silurian *system*. The term is used by various geologists with quite different meanings, mostly, however, as the equivalent of *series*: thus, Cretaceous *system* (the Cretaceous series).

11. In *nat. hist.*: (a) In the abstract, classification; any method of arranging, disposing, or setting forth animals and plants, or any series of these, in orderly sequence, as by classes, orders, families, genera, etc., with due coordination and relative subordination of the several groups; also, the principles of such classification; taxonomy: as, the morphological *system*; a physiological *system*. There is but one adequate and natural system, namely, that which classifies animals and plants by structure alone, according to their degrees of genetic relationship, upon consideration of descent with modification in the course of evolutionary processes; it is the aim of every systematist to discover this true taxonomy and set it forth by classificatory methods. (b) In the concrete, any zoological or botanical classification; any actual arrangement which is devised for the purpose of classifying and naming objects of natural history; a formal scheme, schedule, or inventory of such objects, or a systematic treatise upon them: as, the Linnean or artificial *system* of plants; Cuvier's *system* of classification; the quarianian *system*. Such systems are very numerous, and no two agree in every detail either of classification or of nomenclature; but all have in view the same end, which is sought to be attained by similar methods, and upon certain principles to which most naturalists now assent.—*Abkari system*. See *Abkari*.—*Action of a moving system*. See *action*.—*Adjunct system*, a system of linear equations whose coefficients are the corresponding minors of the determinant of a primitive system. See *binary classification*, under *binary*.—*Brunonian system*, an old medical doctrine formulated by Dr. John Brown, a Scottish physician. It was based on the assumption that the body possesses a peculiar property of excitability, and that every agent capable of acting on the body during life does so as a stimulant. When these stimuli were normal in amount, the condition was one of health; if excessive, causing debility; if insufficient, causing indirect debility.—*Canonical system*, a system of differential equations of the forms

$$dx_i = \frac{\partial \psi}{\partial p_i} dt, \quad dp_i = -\frac{\partial \psi}{\partial x_i} dt, \quad i = (1, 2, 3, \dots, n).$$

See *Linnean*.—**Logierian system**, in music, a system of instruction upon the pianoforte invented by J. B. Logier, and patented in England in 1814. It involved two things—the use of the chiroplast, a mechanical contrivance for holding the pupil's hands in a correct position at the keyboard, and the simultaneous instruction of several pupils at as many pianofortes. The chiroplast had drawbacks which have led to its being discarded, but the plan of class instruction is in use to some extent in all music-schools.—**Lot, Macleayan, male, mark, mercantile, metamorphic, metayer, military, moiety, muscular, natural, nervous, octave system**. It is thus finally made positive that the *Taconic system* is not a pre-Silurian system, and that the claiming for it equivalency with the Huronian was but a leap in the dark. It is manifest, in fact, that "*Taconic system*" is only a synonym of the older term "*Lower Silurian*," as this term was used by geologists generally twenty, thirty, and forty years since, and by many writers till a much later date. *J. D. Dana*, *Amer. Jour. Sci.*, Dec., 1888, p. 411.

See *water-vascular*.—**Syn. 1-4. System, Method**. Strictly, "*System* is logical or scientific collocation. *Method* is logical or scientific procedure" (*C. J. Smith*, *Synonyms Discriminated*). But *system* is often used for *method*; *method* is not used for *system*. *System, Range, Chain*, in *orography*, as used by physical geographers writing in English, are nearly the same; thus, we find the "*Appalachian chain*" frequently called "*Appalachian range*" or "*ranges*," and also "*Appalachian system*." *System* is the more comprehensive term. All the *ranges* which go to make up a complex of mountains sufficiently nearly a unit, as popularly designated, to be embraced under one name, may be called a *system*; thus, the *ranges* of the Great Basin, some twenty or more in number, may properly all be classed together as forming the Great Basin "*mountain system*," or simply "*system*."

As thus defined, the *Appalachian Region, System*, or complex of *ranges*, extends from the promontory of Gaspé, in a mean direction of northeast and southwest, to Alabama—a distance of about 1,300 miles—where it disappears entirely, becoming covered by the much more recent geological formations, which form a broad belt along the Gulf of Mexico, and extend far up the Mississippi Valley. *J. D. Whitney*, *The United States*, p. 32.

tematic arrangement of plants or animals; a systematic course of study.

What I hope to have shown is that two systems of logic are not made the same system by the fact that both are systematic methods of procedure, nor yet by the fact that both express the common part and the aggregate of two terms in the same way.

2. Proceeding according to system or regular method; with intention; formal: as, a systematic writer.

In *astron.*, the conjunction or opposition of a planet with the sun, or of any two of the heavenly bodies. On the phenomena and circumstances of the syzygies depends a great part of the lunar theory.—2. In *anc. pros.*, a group or combination of two feet. Ancient metricians varied in their use of this term. Some use it regularly for a dipody or (dipodic) measure. Others call a tautopody, or double foot, a dipody, but a combination of two different feet a syzygy. Some, accordingly, giving the name *syzygy* to tetrasyllabic feet (regarded by them as composed of two dissyllabic feet), speak of an iambic or a trochaic line as measured by dipodies, but an Ionic line as measured by syzygies—that is, by single Ionics considered as combinations of trochees and pyrrhics. A peculiar use is the restriction of the term *syzygy* to compound feet of five or six syllables.

(b) Suture, or fixed articulation, of any two joints of a crinoid ray, or the joints thus sutured, with partial obliteration of the line of union.

The first of the brachial joints (in the *Pentacrinus asleria*)—that is to say, the joint immediately above the radial axillary—is, as it were, split in two by a peculiar kind of joint, called by Muller a "*syzygy*." All the ordinary joints of the arms are provided with muscles producing various motions, and binding the joints firmly together. The syzygies are not so provided, and the arms are consequently easily snapped across where these occur.

1. The twentieth letter and sixteenth consonant of the English alphabet. Of the Phœnician alphabet the corresponding sign was the twenty-second and last: what follows *t* in Greek and Latin, and also in our own scheme, is the result of successive additions made to the system borrowed from Phœnician. (See the several letters below.) The comparison of forms (compare *A*) is as follows:

The value of the sign has been practically the same through the whole history of its use; it denotes the surd (or breathed) mute (or check) produced by a complete closure (with following breach or explosion) between the tip of the tongue and a point on the roof of the mouth either close behind or not far from the bases of the upper front teeth. Its corresponding sonant or voiced mute is *d*, and its nasal is *n* (see these letters). They are oftentimes called *dental* or *teeth-sounds*, though the teeth have really no part in their production; hence also, and better, *lingual*, or *front lingual*, or *tongue-tip*, etc. They are much more common elements of our utterance than either of the other two classes, palatal (*k, g, ng*) or labial (*p, b, m*); they constitute, namely, about 13 per cent. of the sounds we make (*t* nearly 6 per cent., *d* nearly 5, *n* nearly 7), against palatal 4 per cent., and labial 6½. A sound which our ears would at once recognize and name as a *t*-sound is producible in other positions of the organs than that described above—namely, at points further back on the roof of the mouth, and with parts of the tongue behind the tip, and even of its under surface. Hence the occurrence in some languages of more than one *t*, distinctly recognized as separate members of the spoken alphabet (so two in Sanskrit, etc., and even four in Siamese); our own *t* also which forms the first part of the compound *ch* (*= tsh*) is slightly but constantly different from our *t* elsewhere. As in many other languages (and partly by direct inheritance from French, and even from later Latin, alterations), the *t* in English shows a tendency to become palatalized and converted into a sibilant when followed by palatal sounds, as *t, e, y*. Hence, in many situations, it combines with such sounds, either regularly or in rapid utterance, producing the *ch*-sound, as in *question, mixture* (compare the corresponding conversion of *s* to *sh*, under *S*); and even, in a great number of words having the endings *-tion, -tious, -tial*, etc., it becomes a sibilant and makes the *sh*-sound, as in *nation, factions, partial*, etc. *T* also, like others of our consonants, frequently occurs double, especially when medial: thus (from *fit*) *fitted, fitter, fitting*. With *h*, *t* forms the digraph *th*, which has the position and importance of a fully independent element in the alphabet, with a double pronunciation, surd and sonant (or breathed and voiced): surd in *thin, breath*; sonant in *this, breathe*—both as strictly unitary sounds as *t* and *d*, or *s* and *z*. They are related with *t* and *s*, etc., as tongue-tip sounds, especially with *s* and *z* as being fricative and continuous; but they are of closer position than the latter, the closest that can be made without actual stoppage of the breath, and are usually formed with the tongue thrust further forward, against or even beyond the teeth: hence their substitution for *s* and *z* by persons who lisp. In regard to their grade of closure, they are akin to *f* and *v*, and belong in one class with these (oftenest and best called *spirants*). As an *f* comes in part from an aspirated *p*, or *ph*, so also the *th*-sounds from an aspirated *t*; and in this way they have obtained their usual representation: the Greek *θ*, which was an aspirated *t* (that is, a *t* with separately audible *h* after it), was written in Latin with *th*, and then, when the aspirate came to be pronounced as a spirant, this was continued in use as representative of the latter. And in this case the Latin digraph has crowded out of English use the sign (or rather the two signs) which in Anglo-Saxon represented the *th*-sounds—namely, *þ, ð*—much to the detriment of our present alphabet. Of the two *th*-sounds, the sonant (or *this* and *breathe* sound) is much the more frequent, owing chiefly to the constant recurrence of the pronominal words, particularly *the*, in which it is found; it is nearly 4 per cent. of our utterance, while the surd (or *thin* and *breath* sound) is less than two thirds of one per cent. In the phonetic history of the Germanic part of our language, *th* regularly and usually (when special causes do not prevent) comes from an older *d*; and, on the other hand, *th* from an older *t*: examples for *t* are two corresponding with *dun, eat* with *ad* or *ed*; for *th*, *thou = tu, three = tri, beareth = fert*; for both together, *that = tad, tooth = dent*.

II. *n.* A fly of the family *Tabanidæ*; a horse-fly; a deer-fly; a gadfly or breeze.

Tabanidæ (*ta-ban'i-dê*), *n. pl.* [NL. (Leach, 1819), < *Tabanus* + *-idæ*.] A large family of biting flies, of which *Tabanus* is the typical genus; the gadflies, breezes, or elegs, having the third joint of the antennæ annulate and without a distinct bristle. The proboscis of the female is adapted for piercing, and inflicts a painful although not irritating wound. The male does not bite. They fly with extraordinary speed, and the swiftest horse cannot elude them. The spindle-shaped brown or black eggs are attached in groups to the stems and leaves of low-growing plants, and the larvæ are either aquatic or live in damp earth. They are predaceous, and feed upon snails or small insects. The young larvæ of many species penetrate beetles and other larvæ, and remain within until they have entirely consumed them. Over 1,300 species are known; 150 are North American. Many of them are among the largest and most powerful of the *Diptera*, but most are of moderate size. They fly in bright sunshiny weather. Also *Tabanides*. See cuts under *breeze*, *Chrysops*, and *gadfly*.

Nearly 100 species inhabit North America. *T. atratus* is the common large black horse-fly of the United States; *T. bovinus* is the common gadfly of cattle. See cuts under *breeze* and *gadfly*.

forms, prob. adapted from Hind.] A white opaque or translucent variety of opal which breaks into irregular pieces like dry starch, found in the joints of the bamboo in the East and Brazil, and believed to be caused by disease or injury to the plant. It possesses the power of absorbing its own weight of water, when it becomes entirely transparent. It is probably the "oculus mundi" of the gem-writers of the sixteenth, seventeenth, and eighteenth centuries. Tabebuia (tab-ē-bū'ia), *n.* [NL. (Gomez, 1803), from Braz. name.] A genus of gano-

petalous plants, of the order *Bignoniaceae*, tribe *Tecomaeae*, and section *Digitifoliae*. It is characterized by loosely racemose or cymose flowers with a tubular and at length variously ruptured calyx, an elongated and greatly enlarged corolla-tube, four perfect stamens, and a sessile ovary ripening into a somewhat cylindrical ecostate capsule with numerous flat seeds, each with a large hyaline wing. There are about 60 species, natives of tropical America from Brazil to the West Indies and Mexico. They are erect shrubs or trees, smooth or hairy, often drying black. They bear usually large flowers and alternate or scattered leaves, which are generally composed of five to seven digitate leaflets, sometimes reduced to three or to one. Several species are used medicinally, as *T. im-petiginosa*, which yields a bitter mucilaginous bark and abounds in tannin. Many are valuable trees, yielding an almost indestructible timber; several are known in tropical America as *roble* — that is, *oak* — and are used for house- and ship-building, or for making bows, as *T. toxophora*, the *pao-d'arco* of Brazil. The names *whitewood* and *box-wood* are given to *T. leucocylon* in the West Indies, and the former name also to *T. pentaphylla*; both are timber-trees with whitish bark and white or pink flowers. *T. serratifolia*, a small tree with yellow flowers, is known as *pony* in Trinidad. All the above species were formerly classed under *Tecoma*, but are removed to *Tabebuia* on account of their digitate, not pinnate, leaflets. A very different species, *T. uliginosa*, a shrub with simple entire leaves, is known as *Brazilian cork-tree*, from the use of its soft wood.

tabernacle (tab'ēr-nā-kl), *n.* [*< ME. tabernacle, < OF. (and F.) tabernacle = Pr. tabernacle = Sp. tabernáculo = Pg. tabernaculo = It. tabernacolo, < L. tabernaculum, a tent, LL. (Vulgate) the Jewish tabernacle, dim. of taberna, a hut, shed, booth; from the same root as tabula, a table, tablet: see tavern, table.*] 1. A tent; a pavilion; a booth; a slightly constructed habitation or shelter, either fixed or movable; hence, a habitation in general, especially one regarded as temporary; a place of sojourn; a transient abode.

The tabernacle of the upright shall flourish. Prov. xiv. 11.

Let us make here three *tabernacles*, one for thee, and one for Moses, and one for Elias. Mat. xvii. 4.

The body . . . is but the *tabernacle* of the mind. Bacon, Advancement of Learning, II.

2. In *Biblical phraseology*, the human frame as the temporary abode of the soul, or of man as a spiritual immortal being.

Yes, I think it meet, as long as I am in this *tabernacle*, to stir up you by putting you in remembrance; knowing that shortly I must put off this *my tabernacle*, even as our Lord Jesus Christ hath shewed me. 2 Pet. i. 13, 14.

3. In *Jewish hist.*, a tent constructed to serve as the portable sanctuary of the nation before its final settlement in Palestine. This "tabernacle of the congregation" is fully described in Ex. xxv.-xxvii. and xxxvi.-xxxviii. It comprised, besides the tent, an inclosure or yard, in which were the altar of burnt-offerings and the laver. The tabernacle proper was a tent divided into two chambers by a veil — the inner chamber, or holy of holies, containing the ark of the covenant and the mercy-seat, and the outer chamber the altar of incense, the table of showbread, and the golden candlestick. The tabernacle was of a rectangular figure 45 feet by 15, and 15 feet in height. The court or yard was 150 feet in length by 75 feet, and surrounded by screens 7½ feet high. The people pitched round the tabernacle by tribes in a fixed order during their wanderings, and the pillar of cloud and of fire, denoting Jehovah's presence, rested upon it or was lifted from it according as they were to remain stationary or were to go forward. After the arrival in the promised land it was set up in various places, especially at Shiloh, but gradually lost its exclusive character as the center of national worship before the building of Solomon's temple, in which its contents were eventually placed.

And he spread abroad the tent over the *tabernacle*, and put the covering of the tent above upon it. Ex. xl. 19.

And they brought up the ark [to the temple built by Solomon], and the *tabernacle* of the congregation [tent of meeting, R. V.], and all the holy vessels that were in the *tabernacle*, these did the priests and the Levites bring up. 2 Chron. v. 5.

Hence — 4. A place or house of worship; especially, in modern use, an edifice for public worship designed for a large audience; often now the distinctive name assumed for such an edifice.

The shed in Moorfields which Whitefield used as a temporary chapel was called "The *Tabernacle*"; and, in the scornful dialect of certain Church-of-England men, Methodist and such-like places of worship have, since then, been known as *tabernacles*.

F. Hall, False Philol., p. 24, note.

5. A receptacle for the reserved eucharist; especially, a constructional receptacle for this purpose, containing the pyx. The tabernacle, as now commonly seen in Roman Catholic churches, is a recess with a door, placed over and behind the high altar or one of the side altars, usually having over it a cross or crucifix with a design in relief, the whole surmounted by a canopy. In earlier times a movable ark, or usually a suspended dove (columba) or a tower, held the eucharist or the vessel containing it. In England the general medieval custom was to place the sacrament in an ambry on one side of the sanctuary or in the sacristy. The tabernacle is a later development of the ark or ambry as a permanent construction over the high altar and surmounted by a canopy or ciborium, often in the spire-like shape developed from the older tower; hence the name *tabernacle* is often given especially to this canopy or to canopies of similar appearance.

6. In *medieval arch.*, a canopied stall, niche, or pinnacle; a cabinet or shrine ornamented with

7. *Naut.*, an elevated socket for a river-boat's mast, or a projecting post to which a mast may be hinged when fitted for lowering to pass beneath bridges. [Eng.] — **Feast of Tabernacles**, among the Jews, an annual festival celebrated in the autumn (on the fifteenth day of Tisri) in commemoration of the dwelling of their people in tents during the journey in the wilderness, and as a feast of thanksgiving for the harvest and vintage. Among the ancient Jews it

lasted eight days, during which all the people gathered at Jerusalem and dwelt in booths. (See Lev. xxiii. 34-36; Num. xxix. 12-39.) Among the modern Jews the feast has been prolonged one day.

[Used scornfully in the quotation, with reference to so-called Methodist tabernacles. See *tabernacle*, 4.]

Tabernæmontana (tā-bēr'nē-mon-tā'nā), *n.* [*NL.*, named after Jacobus Theodorus *Tabernæmontanus*, a German physician and botanist (died 1590).] A genus of gamopetalous plants, of the order *Apocynaceæ* and tribe *Plumericeæ*, type of the subtribe *Tabernæmontaneæ*. It is characterized by cymose flowers, a calyx furnished at the base of its five lobes with a continuous or interrupted ring of glands, and a fruit of two many-seeded berries or fleshy follicles which are large and globose or smaller and oblique or recurved. There are about 150 species, widely scattered through tropical regions. They are trees or shrubs, commonly smooth, bearing opposite thin or coriaceous feather-veined leaves. The small cymes of white or yellowish salver-shaped flowers are terminal or variously placed, but not truly axillary. The smooth or three-ribbed pulpy fruit contains several or many ovoid or oblong seeds with fleshy albumen: in several species it is ornamental—in *T. macrocarpa* and others of the section *Rejona*, mainly of the Malay archipelago, resembling a reddish orange in appearance. Instead of the acrid, drastic, and poisonous milky juice of most related genera, many species of *Tabernæmontana* secrete a bland and wholesome fluid, sometimes useful as a nourishing drink, as in *T. utilis*, the cow-tree or hya-hya of British Guiana, which yields a thick, sweet, white liquid, made somewhat sticky by the presence of caoutchouc. This species also yields a soft white wood and a medicinal bark. *T. orientalis*, the Queensland cow-tree, and *T. coronaria*, known as *Adam's apple* or *East Indian rose-bay*, are sometimes cultivated, forming small evergreen trees, the latter under glass and also naturalized in tropical Asia from the Cape of Good Hope. Several other species are cultivated under glass for their large fragrant flowers and ornamental deep-green leathery leaves. *T. crassa*, the kpokpoka-tree of Sierra Leone, produces a fiber there made into a cloth known as *dodo-cloth*. A species in Ceylon, known as *divinadner*, probably *T. dichotoma*, has been called *forbidden fruit*, from its beautiful but poisonous fruit bearing marks fancied to be the prints of the teeth of Eve.

4. In *music*: (a) The system of rules for the poetry of the mastersingers. (b) Musical notation in general. (c) A form of musical notation for various instruments, like the lute, the viol, the flute, the oboe, or the organ, used in Europe from the fifteenth to the beginning of the eighteenth century. It differed from the more general staff-notation in that it aimed to express not so much the pitch of the tones intended as the mechanical process by which on the particular instrument those tones were to be produced. *Tablature*, therefore, varied according to the instrument in view. In the case of the lute, for example, a horizontal line was usually drawn for each string, forming a kind of staff; and letters or numerals were placed on these lines, indicating not only which strings were to be touched, but at what frets they were to be stopped. Various arbitrary signs were also used instead of letters or numerals, or in combination with them. Music thus noted was said to be written *lyra-way*, in distinction from *gamut-way* (in the staff-notation). In the case of wind-instruments, like the

flageolet, points or dots were often placed on horizontal lines to indicate which finger-holes were to be closed to produce the required tones. In the case of the organ, notes were often written out by their letter-names. In all these systems and their numerous variants, marks were added above or below to indicate the desired duration of the tones, the place and duration of rests, and various details of style. *Tablature* had obvious advantages as a notation for particular instruments. Various technical marks now used are either derived from it or devised on the same principle. The tonic sol-fa notation, that of thorough-bass, and the little-used systems of numeral or character notes are essentially analogous to it. Also *tablature*.

and pivoted centrally to an oscillating arm which has at
the other end a fixed bearing. It receives motion from a
crank and pitman, the latter being pivoted to the mov-
ing table at a considerable distance from the first-named
pivot. This arrangement produces a motion of the table
analogous to that of hand-rubbing. The moving table is
weighted on the upper side, and faced on the under side
with slate, and it works over a large flat bed. In use, a
plate of glass is cemented to the slate face of the mov-
ing table and another to the bed. The upper plate is

with the use of coarse emery. This is succeeded by the
use of finer grades. The final polishing is done by an-

top of which is divided into a fixed central part and two
leaves, which are hinged to the sides of the fixed part and
made to be folded down, so that the table may take up
but little room when not in use. The leaves, when raised,
were supported originally by a sort of frame, swinging on a
hinge or on pivots, and with a leg reaching the floor, thus
making an additional leg of the table for each of the
leaves. For this movable frame a hinged or sliding bracket
is now often substituted.—Pillar-and-claw *table*, a
table with a central support like a pillar, to the top of which
the slab or top of the table is usually hinged; the pillar

The ancient writers used both names [holy table, altar]
indifferently, some calling it altar; others, the *Lord's table*,

same sentence together. *Bingham*, Antiquities, viii. 6.

A gum-resin, the product of several trees, originally that of one or more South American species. The most important *tacamahac* is derived from *Calophyllum Inophyllum*, of the East Indies, Polynesia, etc. (see *tamanu*), of which the *C. Tacamahaca* of Madagascar and the isle of Bourbon is a variety. The resin is of a greenish-yellow color, liquid at first, but hardening into a brittle aromatic mass soluble in alcohol and ether. It exudes spontaneously or through incisions from the bark and roots. A similar gum is afforded by *C. Calaba* in the West Indies. The South American *tacamahac* is the product of *Bursera* (*Elaphrium*) *tomentosa* and *B. excelsa*, of *Protium* (*Iceia*) *heptaphyllum*, and perhaps of some other trees. The buds of *Populus balsamifera* (see def. 2) are varnished with a resin which may be included under this name, occasionally used in the place of turpentine and other balsams. *Tacamahac* is sometimes used for incense, was formerly an esteemed internal remedy, and may still be somewhat used in plasters, but is very little in the market. In this sense often *tacamahaca*.

The mercury in the tube descends at the same time, and the degree of this descent is measured by a scale attached to the tube. The velocity of the machine being lessened, the mercury rises in the center, causing a proportionate rise in the tube. (e) Something added or tacked on to the close of a composition or a performance; an extrinsic or explanatory supplement. In this use the envoy of a poem, the moral of a fable, or the appendix (but not properly the index) to a book is a *tag*; but the word is used technically of a closing speech or dialogue supplementary to a speech in a play, not necessary to its completeness, and often constituting a direct appeal to the audience for applause.

Tages*, an Etruscan divinity, commonly represented as a beautiful youth.] A genus of composite plants, of the order *Helminthoidæ*, type of the subtribe *Tagetinae*. It is characterized by usually radiate flower-heads with a papus of five or six awns, and surrounded by a single row of equal involucre bracts which are connate into a more or less lobed cup or cylinder, and are dotted with oily glands.

There are about 20 species, natives of America from Buenos Ayres to Mexico. They are smooth erect branching or diffuse herbs, bearing opposite and commonly pinnately dissected leaves, and yellow or orange flower-heads, which are long-stalked, large, and showy, or densely corymbed and smaller. Many species have an offensive odor; *T. micrantha* has the scent of anise. The two most commonly cultivated species, *T. patula*, the French marigold, and *T. erecta*, the African marigold, are strong-scented annuals; the latter, the African tansy or *flos Aphricanus* of the herbalists (from De L'Obel, 1581), now occurs naturalized in China and India, where it has been extensively cultivated. *T. tenuifolia* (*T. signata*), a nearly scentless Peruvian species, is valued for its long-continued flowering. *T. lucida*, a Mexican perennial cultivated for its numerous small yellow fragrant flowers, approaches the southern border of the United States, and two species, *T. micrantha*, with inconspicuous flowers, and *T. The posterior extremity of an animal, in any way distinguished from the rest of the body; the hind end or hinder part of the body, opposite the head; especially, the coccygeal region or caudal appendage, when prolonged beyond the rest of the body. More particularly—(a) In mammals generally, the cauda, which may be a mere stump, or a slender appendage longer than the rest of the body. It consists of an indefinitely numerous series of coccygeal vertebrae with usually elongated bodies and reduced or aborted processes or neural canal, covered with flesh, etc., and enveloped in integument frequently hairy, like the rest of the body. These vertebrae resemble the joints or phalanges of a finger, and the whole organ is usually flexible, and may be prehensile, like a hand. In mammals without hind limbs, as cetaceans, the tail is the small or tapering hind part of the body ending in the flukes, or the flukes themselves. (b) In birds, the tail-feathers collectively. (c) In reptiles, the prolongation of the body behind the anus, of whatever character. In reptiles with legs, as crocodiles, turtles, most lizards, and nearly all batrachians, the tail obviously corresponds to the part so named in mammals; it is often extremely long, slender, flexible and lash-like, and generally fragile. It may be sometimes replaced by a new growth when broken off. In serpents and other limbless reptiles the tail is marked by the position of the anus as indicating the end of the body-cavity; it is solid and muscular, and often differently scaled from the parts in advance of it. (d) In fishes (as in cetaceans, above), the tail is the postabdominal part of the body, behind the anus, usually tapering and ending in the caudal fin; also, this fin itself in some cases. In such fish-like vertebrates as the rays, the tail is often a long, slender, whip-like appendage, well distinguished from the rest of the body. See cuts under *fish* and *diphy-cercal*. (e) In crustaceans, the abdomen or abdominal region, with its appendages; the part of the body which succeeds the cephalothorax; the urosome. It is usually conspicuous, and may be longer than the rest of the animal. It is well marked in the macrurous or long-tailed crustaceans, as lobsters, prawns, shrimps, crawfish, etc., consisting of a series of flexible segments with appendages in the form of swimmerets, a rhipidura, a telson, etc. In the short-tailed or brachyurous crustaceans, as crabs, the tail is reduced and folded closely under the body, forming the apron. (f) In insects, the end of the abdomen, in any way distinguished; the pygidium; the claspers; the ovipositor, etc.: as, the bee carries a sting in its tail. (g) In many arachnids, as scorpions, a well-marked abdominal or postabdominal region of the body, behind the thorax: its character is similar to that of the tail of a crustacean. (h) In worms, etc., the tail-end, or any part of the body away from the head. It is sometimes well marked, as in *Cephalobranchia*. Compare *tag-tail*, 1. (i) The buttocks. [Low.]

2. In the Turkish empire, a horsetail, or one of two or three horsetails, formerly borne as a standard of relative rank before pashas, who were accordingly distinguished as pashas (or bashaws) of one, two, or three tails.—3. A tail-like appendage or continuation; any terminal attachment to or prolonged part of an object comparable to the tail of an animal: as, the tail of a kite, or of the letter *y*; the tail of a coat (a coat-tail), or (colloquially) of a woman's long dress.

The tails of certain letters are curved, the curve being represented on the refractory terra cotta by two scratches, which together form an angle. *Science*, XVI, 172.

He crossed the room, stepping over the tails of gowns, and stood before his old friend. *The Century*, XXXVI, 128.

Specifically—(a) In *anat.*: (1) The slenderest or most movable part of a muscle, or the tendon of a muscle that is attached to the part especially moved when the muscle acts; the insertion, opposite the origin or head. (2) The outer corner of the eye; the exterior canthus: more fully called *tail of the eye*. (b) In *entom.*, one of the long slender prolongations backward of the wings, as of a butterfly or moth: more fully called *tail of the wing*. See cut under *Papilio*. (c) Some elongated flexible part or appendage, as a proboscis or footstalk. (d) In *astron.*, the luminous train, often of enormous length, extending from the head of a comet in a direction nearly opposite to that of the sun. These coverts are divided into superior and inferior, or upper and under coverts. They are commonly short, covering only the bases of the rectrices, but sometimes extend far beyond them; the gorgeous train of the peacock, for example, consists of tectrices, not rectrices, as is also the case with the beautiful train of the paradise stork. The ornamental feathers called *marabout-feathers* are the under tail-coverts of a species of stork, and in certain other storks these coverts simulate rectrices. tail-feather (tāl'feth'ér), *n.* One of the feathers of a bird's tail; specifically, the rectrices, or rudder-feathers, usually stiff pennaceous feathers, always devoid of a hyporachis, as distinguished from the tectrices or tail-coverts. Tail-feathers, like flight-feathers, have for the most part a wide inner and narrow outer vane, and when the tail is closed or folded they overlap one another alternately from side to side. The two middle feathers, whose webs are more nearly equal, and which overlap all the rest, are sometimes distinguished as *deck-feathers*. Tail-feathers are always paired, and hence of an even number. The number prevailing among birds is 12; this is characteristic, having few exceptions among all *Passeres*, whether oscine or clamaratory, and among many other birds, as birds of prey. In picarian birds 10 is the rule, though many have 12, and a few only 8; woodpeckers have 12, though apparently 10, one pair being rudimentary. In pigeons the rule is 12 or 14: sometimes there are 16 or 20. In gallinaceous birds the numbers run from 12 to 18 or 20. Waders have usually 12, often more, up to 20. Swimming-birds have sometimes only 12, usually higher numbers, as 16, 18, 20, 24, or even 32. The archæopteryx appears to have had 40. In a few birds the tail-feathers proper are extremely modified, as in the lyre-bird. (See *Memura*, *Trochilidae*.) Tail-feathers which project far beyond the rest are said to be *long-exserted*. Shapes of individual rectrices are described as *truncate*, *incised*, *linear*, *acute*, *acuminate*, *filamentous*, *spatulate*, *micronate*, etc. (See these words.) The relative lengths of rectrices go far to determine the shape of the tail as a whole, which is usually in the form of a fan. The termination of the tail is described as *even*,

truncate, acute, acuminate, cuneate, forked, forficulate, furcate, emarginate, rounded, double-rounded, double-forked, etc. When the tail-feathers of opposite sides come together vertically, as in the rare but familiar case of the barnyard fowl, the tail is said to be *complicate* or *folded*. The same tendency in the reversed direction results in the *scaphoid* or *boat-shaped* tail. A tail-feather spatulate at the end is called a *racket*. Some tail-feathers are coiled, *circinate* or *scorpioid*; others form a lyrate figure. A few birds, as grebes, have only rudimentary or no proper tail-feathers. The word is loosely extended to include tail-coverts in some cases. See cuts under *boat-shaped*, *Cinnurus*, *tyre-bird*, *Sappho*, *Spathura*, and *Topaza*.

In *surg.*, same as *tail*¹, 5 (*e.*).—3. *pl.* The parts or a part of any incoherent or fluid material separated as refuse, or separately treated as inferior in quality or value; leavings; remainders; dregs. The tailings of grain are the lighter kernels blown away from the rest in winnowing; of flour, the inferior kind separated from the better in bolting. Tanning-liquor that has become "sour" or impure is called *tailings*. In metallurgy tailings are the part rejected in washing an ore that has passed through the screens of a stamp-mill, the worthless slimes left after the valuable portion has been separated by dressing or concentration. The part rejected as tailings may, however, at a future time be worked over and made to undergo still further concentration. The sand, gravel, and cobbles which pass through the sluices in hydraulic mining were formerly generally designated as *tailings*; of late years, and especially in State and United States legislative documents, they have been called "mining debris" or simply "debris."

The refuse material thrown aside in quartz, drift, hydraulic, or other mines, after the extraction of the precious metal, is called *tailings*. The *tailings* from hydraulic mines are called "debris" also.

tailor-bird (tāl'or-bērd), *n.* One of various small passerine birds of the Oriental or Indian region, noted for the ingenuity with which they sew leaves together to form a nest. ter in 1781 as *Motacilla sutoria*, and given a French name by Sonnini in 1782, with reference to the two long middle tail-feathers. These descriptions furnished two nominal species, long known as *Sylva sutoria* and *S. longicauda* respectively, till Horsford in 1820 founded a genus *Orthotomus* upon *O. sepium*; after which the original tailor-warbler was usually placed in *Orthotomus*, and received in the course of time several other specific designations. In 1851 Nicholson founded the genus *Sutoria* upon the original type species of Forster, Sonnini, and Latham; and in 1831 Lesson founded a nominal genus *Edela* upon a species of *Orthotomus*. The result of this by no means remarkable confusion in generic names is that the species of *Sutoria* proper have usually been called *Orthotomus*. (*a*) There are 3 species of *Sutoria*, or tailor-birds proper: *S. sutoria* or *S. longicauda* (mostly called *Orthotomus sutorius* or *O. longicauda*), throughout India and Ceylon, in parts of China, in Formosa, Hainan, etc.; *S. edela* of Java; and *S. maculicollis* of the Malay peninsula. In *classical myth.* and *archæol.*, the sandals, bearing small wings, worn characteristically by Hermes or Mercury and often by Iris and Heos (Dawn), and by other divinities, as Eros and the Furies and Harpies. In late or summary representations of the deity the sandals are sometimes omitted, so that the wings appear as if growing from the ankles, one on each side of the foot. Sometimes, especially in archaic examples, the talaria have the form of a sort of greaves bearing the wings much higher on the leg. They symbolize the faculty of swift and unimpeded passage through space.

talbot (tāl'bōt), *n.* [Probably from the *Talbot* family, who bear the figure of a dog in their coat of arms.] 1†. A kind of hound, probably the oldest of the slow-hounds. This dog had a broad mouth, very deep chops, and very long and large pendulous ears, was fine-coated and usually pure-white. This was the hound formerly known as St. Hubert's breed, and is probably the original stock of the bloodhound.

Jesse says the earliest mention of bloodhounds was in the reign of Henry III. The breed originated from the *talbot*, which was brought over by William the Conqueror, and seems to have been very similar to the St. Hubert.

Its prevailing colors are white, apple-green, and yellow. There are three principal varieties of talc—foliated, massive (including soapstone or steatite), and indurated. Indurated talc is used for tracing lines on wood, cloth, etc., instead of chalk. Talc is not infrequently formed by the alteration of other minerals, particularly the magnesian silicates of the pyroxene group; thus, *rensselaerite* is talc pseudomorphous after pyroxene, and a fibrous form of talc (sometimes called *agalite*), pseudomorph after enstatite, is found at Edwards, New York, and when finely ground is used in giving a gloss to paper. Talc is also used as a lubricator, and steatite or soapstone for hearthstones, etc.

The deflected uses of the word in ML. and Rom. are due in part to the fig. sense 'wealth,' and in part to the sense 'gift, endowment,' suggested by the parable of the talents (Mat. xxv.).] 1. An ancient denomination of weight, originally Babylonian (though the name is Greek), and varying widely in value among different peoples and at different times. All the Assyrian weights had two values, the heavy being double the light, and there were also various types of each. The royal Babylonian commercial talent (or Assyrian talent) was divided into 60 minas, and each mina into 60 shekels. Its value (light weight) was in one type 29.63 kilograms (65 pounds 5 ounces avoirdupois), and in another 30.10 kilograms (66 pounds 5½ ounces). Derivatives of this talent (which was equivalent to 3,000 shekels) were in use in Syria and Palestine and in Phœnician colonies. Its money value is reckoned as approximately from \$1,700 to \$2,000. The Babylonian gold talent contained only 50 minas, and was thus five sixths of the commercial weight. The Babylonian silver talent was formed by multiplying the commercial talent by 1¼ (the ratio of silver to an equivalent mass of gold), and afterward dividing by 10. The resulting light talent was sometimes again divided by 2. Derivatives of this talent were in use in Persia, Lydia, Macedonia, and Italy. It is the basis of much of the most ancient silver coinage. The Phœnician silver talent, probably derived from the Babylonian, was in its lighter types about 43.4 kilograms (95 pounds 9 ounces avoirdupois), and being halved, was adopted into the Ptolemaic system. The chief Greek talents were as follows: Old Æginetan, 40.3 kilograms (88 pounds 12 ounces); emporitic Attic (substantially later Æginetan), 36.4 kilograms (80 pounds 4 ounces); Solonic (= Egyptian), 26.5 kilograms (58 pounds 14 ounces). Talents mentioned by Homer and some other of the oldest writers appear to be small weights, perhaps shekels. The later Attic talent contained 60 minas, or 6,000 Attic drachmas, equal to 56 pounds 14 ounces. As a denomination of silver money it was equal to about \$1,000. The great talent of the Romans is computed to be equal to £99 6s. 8d. sterling, or about \$480, and the little talent to £75 sterling, or about \$363.

According to Skeat, the ME. *talken* is derived from Sw. *tolka* = Dan. *tolke*, interpret, explain, = Icel. *tálka*, interpret, plead one's case, < Sw. Dan. *tolk* = Icel. *tolkr* = D. *Mitt*, *tolk*, an interpreter (ME. *tolk*, *tolk*, a man), < Isth. *tolkas*, an interpreter (see *tolk*); but this notion is inconsistent with the form of the verb (no ME. form **tolken* appears in either sense 'talk' or 'interpret'), with phonetic laws (ME. **tolken* would not change to *talken*, and would not produce a mod. form *talk*, pron. tāk), and with the sense ('talk' and 'interpret' being by no means identical or adjacent notions). The fact that the formative *-k* is not common in ME. is not an argument against its admission in this case, inasmuch as it does actually occur in *stalk*¹, *smirk*¹, and other cases. = *Syn. 1* and *2*. *High, Tall, Lofty.* *High* is the most general of these words, and has some uses different from those of the others. When we say that a cloud is *high*, we may mean that it extends very far upward, or, more probably, that it is unusually far above the earth. *Tall* describes that which is slim in proportion to its height, as a mast, a pine or other tree, a steeple, a person, possibly a cliff: *tall* houses may be found in some parts of the world; a *tall* cloud would be of small width and great comparative height. *Tall* is also associated with height to which we are used or which we have come to regard as standard. A giant is *tall*, because so much *taller* than most men. *Lofty* denotes an imposing height: a room cannot well be *tall*, but may be *high*, or even *lofty*: as, the *lofty* arches of Westminster Hall. *High* and *lofty* may have application to moral or intellectual character; *tall* has not, except colloquially. *Tall* seems somewhat figurative when applied to that which does not live and grow.

In commerce tallow is divided into various kinds according to its qualities, of which the best are used for the manufacture of candles, and the inferior for making soap, dressing leather, greasing machinery, and several other purposes. It is exported in large quantities from Russia.

tally¹ (tal'i), *n.*; pl. *tallies* (-iz). [Formerly also *tallie*; *< ME. taly, talye*, a later form of *taille, taile, taylor*, etc., a cutting, a cut, etc.: see *tall²*.] 1. A piece of wood on which notches or scores are cut to mark numbers, as in keeping an account or giving a receipt; loosely, anything on which a score or an account is kept. Before the use of writing, or before writing became general, this or something like it was the usual method of keeping accounts. In purchasing and selling it was customary to make duplicate tallies of the transaction, or to split one tally through the middle. In the English Exchequer tallies were used till 1812, which answered the purpose of receipts as well as simple records of matters of account. An Exchequer tally was an account of a sum of money lent to the government, or of a sum for which the government would be responsible. The tally itself consisted of a squared rod of hazel or other wood, having on one side notches indicating the sum for which the tally was an acknowledgment. On two other sides, opposite to each other, the amount of the sum, the name of the payer, and the date of the transaction were written by an officer called the writer of the tallies. This being done, the rod was then cleft longitudinally in such a manner that each piece retained one of the written sides, and one half of every notch cut in the tally. One of these parts, the *counterfoil* or *counterstock*, was kept in the Exchequer, and only the other, the *stock*, issued. When the part issued was returned to the Exchequer (usually in payment of taxes) the two parts were compared, as a check against fraudulent imitation. This was called *tally* or *tallie*. The size of the notches made on the tallies varied with the amount. The notch for £100 was the breadth of a thumb; for £1 the breadth of a barleycorn. A penny was indicated by a slight slit.

Alas! I cannot pay a jot; therefore
I'll kisse the tally, and confesse the score.
Herriek, To God.

Have you not seen a Baker's Maid
Between two equal Panniers sway'd?
Her Tallies useless lie, and idle,

On either side you hear 'em clatter.

Prior, Alma, ii.

3. A mark made to register a certain number of objects; one of a series of consecutive marks by which a number of objects are recorded or checked; also, a number as thus recorded; a number serving as a unit of computation. Thus, when packages of goods of uniform size and character are being delivered and an account of them taken, every fifth mark usually is called *tally*, and in counting aloud the word *tally* is used instead of five, after which the enumeration begins again; this is marked on a clerk's book, tally being the diagonal mark; though sometimes each mark is a *tally*, and the fifth or diagonal one is a *tally* of tallies.

talmi-gold (tal'mi-göld), *n.* One of the many names given to brass of varying composition as used for a cheap imitation of gold. Various alloys sold under this name in France have been found to contain from six to fifteen per cent. of zinc, the rest being copper. Some articles sold as talmi-gold really have a coating of gold welded to the brass by rolling, and these retain their gold-like appearance for a long time; other cheaper varieties are simply brass with an exceedingly thin coating of gold deposited on it. Also called *Abyssinian gold*.

By some *Talmud* is made synonymous with *Gemara*. As there are two *Gemaras*—the Palestinian and the Babylonian—so there are two *Talmuds*. See *Mishnah* and *Gemara*.

The *Talmud* . . . is the work which embodies the civil and canonical law of the Jewish people. It contains those rules and institutions by which, in addition to the Old Testament, the conduct of that nation is regulated. Whatever is obligatory on them, besides the law, is recorded in this work. Here doubts are resolved, duties explained, cases of conscience cleared up, and the most minute circumstances relative to the conduct of life discussed with wonderful particularity. *Kitto*, Cyc. of Bib. There are two main modifications of the family—moles proper, *Talpinae*, and musk-shrews, *Myogalinae*. The tamarind is widely cultivated through the tropics, being desir-

able for its fruit, shade, and timber, and for the fragrance of its flowers. It reaches a height of 60 or 80 feet, with a widely spreading crown of dense foliage. The fruit is a thickened pod, 3 to 6 inches long, with a brittle brown shell containing a fibrous juicy pleasantly acid pulp inclosing the seeds. The pulp is used in hot countries to make cooling drinks, and preserved in syrup or sugar, or alone, it forms the tamarinds of commerce. It is used also in preparing tamarind-fish. It is officially recognized as a refrigerant and laxative. Besides the pulp, the seeds, flowers, leaves, and bark all have their medicinal applications in India or elsewhere. The leaves in India form an ingredient in curries. The wood is very hard and heavy, yellowish-white in color with purple blotches, and is used in turnery. — **Bastard tamarind**. It is characterized by flowers with colored caducous bracts, four sepals, three perfect and two rudimentary petals, three perfect monadelphous stamens, and a few staminodes in the form of minute teeth; and by the fruit, a thick indehiscent legume with a fragile crustaceous epicarp, pulpy mesocarp, and thick coriaceous endocarp forming partitions between the seeds. The only species, *T. Indica*, is widely diffused through the tropics, indigenous in Africa and Australia, and naturalized from cultivation in Asia and America. It is a tree bearing abruptly pinnate leaves, with many pairs of small leaflets, and yellow and red flowers in terminal racemes. See *tamarind*. 2. Tamarisceæ (tam-a-ris'ē-ē), *n. pl.* [NL. (Benthams and Hooker, 1862), < *Tamariscus* + -æ.] A tribe of plants, of the order *Tamariscineæ*. It is characterized by racemose or spiked flowers with free or slightly coherent petals, and numerous small smooth seeds without albumen, and terminated by a coma of long plumose hairs. Besides the type, *Tamarix*, it includes the genus *Myricaria*, comprising a few similar but smaller European and Asiatic species growing in sand. **Tamariscineæ** (tam'a-ris-sin'ē-ē), *n. pl.* [NL. (A. N. Desvauz, 1815), < *Tamariscus* + -inæ.] An order of plants, the tamarisk family, of the series *Thalamifloræ* and cohort *Caryophyllinæ*. It is characterized by usually shrubby stems clothed with small undivided alternate leaves, and by flowers with five or more stamens, a one-celled ovary with three to five placentæ, and the sepals and petals free or more or less united. It includes about 45 species, belonging to 5 genera classed in 3 tribes, for the types of which see *Tamarix*, *Rhamnaria*, and *Fouquieria*. They are natives of temperate and warmer regions of the northern hemisphere and also of South Africa, occurring mostly in maritime salt-marshes or in sands and gravelly places among mountains. Unlike the related *Caryophyllaceæ*, or pink family, the seeds are either pilose, comose, or winged, which, together with the frequent willowy habit and narrow leaves, has suggested a superficial resemblance to the order *Salicineæ*, the willow family. Many species have also been compared to the cypress, from their appressed scale-like leaves and tall slender stems. They are shrubs, rarely herbs or trees, their leaves commonly somewhat fleshy, and their flowers either small or showy, usually flesh-colored, pink, or white.

Tamariscus (tam-a-ris'kus), *n.* [L.] One of the old names for the tamarisk used by botanists and herbalists. **tamarisk** (tam'a-risk), *n.* [Formerly also *tamarie*, *tamrick*, *tamricke*, < ME. *tamarike*, *tamarake* (< L. *tamarix* (*tamaric*), *tamarice*, ML. *tamarica*); = F. *tamaris*, *tamariz* = Pr. *tamarise* = Sp. *tamariseo*, *tamariz* = Pg. *tamariseo*, *tamariz* = It. *tamariseo*, *tamarice*, < L. *tamariscus*, also *tamarix* (*tamaric*), *tamarice*, ML. also *tamarica*, *tamarisk*; perhaps connected with Skt. *tamālaka*, *tamālākā*, *tamāla*, a tree with a dark bark, < *tamas*, darkness: see *dim*.] 1. A plant of the genus *Tamarix*; sometimes called *flowering cypress*. The common tamarisk is *T. Gallica*, a shrub or small tree of the Mediterranean region and southern Asia. It is a prized ornamental shrub of feathery aspect, with scale-like leaves, and bearing clouds of pink flowers in late summer. It is a highly adaptable plant, thriving in wet, dry, or salty ground, rooting readily from slips and pushing forth vigorously; hence it is suitable for planting on shores and embankments. In the northern United States, however, it dies

to the ground in severe winters. The stem and leaves contain much sulphate of soda. A variety produces Jew's or tamarisk manna. (See *manna*.) *T. articulata* (*T. orientalis*) is the chief source of tamarisk-galls, which are said to contain 50 per cent. of tannin, and are used in dyeing and medicine. It is found in northwest India and westward, and is sometimes distinguished as *tamarisk salt-tree*, from its secreting salt which incrusts its trunk in sufficient quantity for some culinary use. It is a bush or tree of coniferous aspect. *T. dioica* of India, etc., yields a pale-yellow soluble resin.

It is distinguished by its free or slightly united stamens, and ovary usually with three or four short styles. They are shrubs, sometimes arborescent, bearing minute scale-like clasping or sheathing leaves. It is characterized by small discoid corymbose flower-heads with a naked receptacle, involucre bracts in numerous rows, pappus mostly a ring or crown, and usually two kinds of flowers, the outer row female, slender and tubular, with an oblique or a two- or three-toothed apex, and three-angled achenes, the central flowers numerous, perfect, cylindrical, five-toothed, and with five-angled achenes. There are about 30 species, natives of Europe, northern Africa, central and northern Asia, and North America. They are erect annual or perennial herbs, rarely shrubby at the base, commonly strong-scented and hairy or silky. They bear alternate and usually variously dissected leaves, and yellow flowers. A few exceptional species produce larger solitary long-stalked flower-heads. Seven species are native to the western United States, and *T. vulgare* (for which see *tansy*) is naturalized in the Atlantic States and Canada. tanager (tan'a-jēr), *n.* [*< NL. Tanagra*, *q. v.*] Some or any tanagrine bird; a member of the *Tanagridæ*. Few of these numerous brilliant birds are

actually known as *tanagers* except in technical treatises. Those to which the name is chiefly given are the few species which are conspicuous in the woodlands of the United States. These are the common scarlet tanager, or black-winged redbird, *Piranga rubra*, and the summer redbird, or rose-tanager, *P. aestiva* (also called *cardinal tanager*). Both of these inhabit the eastern parts of the country to New England and Canada. The male of the former is scarlet, with black wings and tail; the male of the latter is rosy-red all over; the females of both are greenish and yellow. In western North America are the Louisiana tanager (so called when much of the region west of the Mississippi was known as Louisiana), *P. ludoviciana*, the male of which is yellow and black, with a crimson head, and the hepatic tanager, *P. hepatica*, a dull liver-red and gray species of the southwest. The foregoing are all 6 or 8 inches long. A tiny and very beautiful tanager, *Euphonia elegantissima*, which is chiefly blue, yellow, and black, comes from Mexico near or over the southern United States border. (See cut under *Tanagridæ*.) Throughout all the woodland of tropical and subtropical America tanagers abound, and represent, with the mannikins, cotings, and tyrant-flycatchers, the leading passerine birds of these regions. See cuts under *Piranga*, *Procnias*, *Saltator*, *Stephanophorus*, *Tanagra*, *Tanagridæ*, *Phenicephalus*, and *cashew-bird*.—**Black-faced tanager**, one of the bullfinch tanagers, *Pitylus grossus*, called by Latham *white-throated grosbeak*.—**Black-headed tanager**, *Lanio atricapillus*, of an orange-yellow color varied with orange-brown, black, and white. It inhabits northerly parts of South America.—**Brazilian tanager**, *Rhamphocelus brasiliensis*, 7½ inches long, the male rich scarlet with black wings and tail, the bill black with the enlarged base of the under mandible white. (b) Any finch of the genus *Paroaria*.—**Cooper's tanager**, a western variety of the summer tanager.—**Crested tanager**, specifically, *Tachyphonus cristatus*, the male of which is chiefly black with a long scarlet crest. It is not a tanager, but a guiguit (*Cuculidae*).—**Scarlet tanager**, *Piranga rubra*, the black-winged redbird of the United States and warmer parts of America. The adult male is scarlet with black wings and tail, 7 inches long and from 11 to 12 inches in extent.

They have nine primaries, scutellate tarsi, and more or less conirostral bill, which usually exhibits a slight notch. They are confined to America, and almost entirely to the Neotropical region, only one genus (*Piranga*) having any extensive dispersion in North America. They are small birds, the largest scarcely exceeding a thrush in size, and the average length being about 6 inches. They are remarkable even among tropical birds for the brilliancy and variety of the plumage, in

In some instances the bill is strongly notched, and even toothed. The family has never been satisfactorily defined, and is probably inausceptible of exact technical delimitation. It includes several hundred species, of numerous genera. It is divided by Salter into *Procnictidae*, *Euphoniidae*, *Tanagrinae*, *Amphispinidae*, *Phainopepla*, and *Pitohuiidae*. tangent (tan'jent), *a. and n.* [= F. *tangent* = Sp. Pg. It. *tangente*, < L. *tangere* (t)-s, ppr. of *tangere* (pp. *tactus*) (< *√ tag*), touch, akin to E. *take*: see *take*. From the L. *tangere* are also

E. tact, tactile, contact, contingent, etc.] **I. a.** Touching; in *geom.*, touching at a single point: as, a *tangent* line; curves *tangent* to each other. — **Stationary tangent plane of a surface.** See *stationary*. — **Tangent plane**, a plane which touches a curved surface, as a sphere, cylinder, etc.

II. n. 1. In *geom.*: (a) A straight line through two consecutive points (which see, under *consecutive*) of a curve or surface. If we take the line through any two points of the locus, and then, while one of these points remains fixed, consider the other as brought by a continuous and not infinitely protracted motion along the locus into coincidence with the former, the line in its final position will be a tangent at that point. The idea of time which appears in this definition is only so far essential that some parameter must be used in order to define a tangent at a singular point, and this parameter must be such as to present no discontinuity or point-singularity at that point. A tangent at an ordinary point of a curve or surface may be defined, without the use of any parameter, simply as a line through two points infinitely close together; although, if the doctrine of limits is used to explain away the idea of infinity, a parameter will be used for that purpose. A curve has only one tangent at an ordinary point, or a mere line-singularity, or a cusp, but

strings, and produce tones. Its action was not like that of the pianoforte-hammer, since it remained in contact with the string, and fixed the pitch of the tone by the place where it struck. If pressed too hard, it raised the pitch by increasing the string's tension. Accordingly the tone of the clavier was necessarily weak. — **Artificial tangents.** See *artificial*. — **Chief tangent**, a tangent to a surface which is also a tangent of the intersection of the surface by the tangent plane at the same point of tangency. — **Conjugate, cotiple, double, imaginary, inflectional tangent.** See the adjectives. — **Ideal tangent**, a real line touching a real curve at two imaginary points. — **Inverse method of tangents**, the method of finding the curve belonging to a given tangent. — **Method of tangents.** (a) A method of obtaining the quadrature of a curve by means of an evaluation of the tangent to it, due to Roberval. (b) Any method of drawing a tangent to a curve. — **Multiple tangent.** See *multiple*. — **Natural tangents**, tangents expressed by natural numbers. — **Principal tangent**, a tangent bisecting the angle between the chief tangents at the point of tangency. — **Principal tangent conic.** See *conic*. — **Stationary tangent of a curve.** See *stationary*. — **Tangent balance**, a balance in which no weights are used, but the position of the beam, as indicated by a pointer moving over a graduated scale, shows the weight: chiefly used for weighing letters. Also called *bent-lever balance*. — **Tangent galvanometer.** See *galvanometer*. — **Tangent sailing.** Same as *middle-latitude sailing*. See *latitude*. — **Tangent scale**, in *ordnance*, a notched piece of metal fitted to slide circumferentially on the breech of a piece of artillery, the notches being at stated distances from the axis of the gun. In sighting, the scale is turned till one of its notches corresponding to the desired elevation or range is brought into intersection with the plane of the trajectory. — **Tangent screw**, a screw attached to or forming part of a clamp, and serving to move pieces clamped together relatively to one another with a slow motion. — **To fly or go off at a tangent**, to pass suddenly from one line of action or train of thought to another diverging widely from the first.

Tangent Scale.

Tangent Balance.

has two or more tangents at a node. A surface has a single infinity of tangents lying in one plane at an ordinary point; and two of these (real or imaginary), called the *inflectional tangents*, pass through three or more consecutive points of the surface. On the nodal curve of a surface the tangents lie in two or more tangent planes; at a conical point they are generators of a quadric cone. The tangents of a curve in space form two sets which are all generators of one developable. There are points upon some curves and surfaces at which, according to the doctrine of limits, there are no tangents. Such is the point in the second figure where the two multiple tangents intersect; for, as a second point on the curve moves toward this, the line through the two points will oscillate faster and faster, without tending toward any limit. In the same sense, a curve may have no tangent at any point; it may be an undulating line with small undulations on the large ones, and still smaller on these, and so on *ad infinitum*, the lengths and amplitudes of the undulations being duly proportioned. But an intelligence situated on such a curve might see that the tangent had a definite direction, for there is no logical absurdity in this. It is antagonistic to the principle of duality which rules modern geometry to define the tangent of a plane curve as the line through two consecutive points on the curve. On the contrary, the definition of a plane curve is a locus described by the parametric motion of a line with a point upon it, the point slipping along the line and the line turning about the point; and such a generating line is a tangent. In like manner, a surface is the locus formed by a plane with a point upon it, the position of the point in the surface and the aspect of the surface about the point varying, the one and the other, according to the variations of the same pair of independent parameters. Such a plane is a tangent plane, and a tangent may equally be conceived as the line through two consecutive ineunt points, or as the line of intersection of two consecutive tangent planes. The tangent plane of a spacious curve is a line lying in a plane and having a point upon it, the plane turning continuously about the line, the point moving along the line, and the line turning in the plane around the point as a center. Euclid's definition of a tangent ("Elements," bk. iii., def. 2) as a line meeting a circle and not crossing it when produced does not extend to curves having inflections. The definition of the tangent as the limiting case of a secant, which is due to Descartes (but was perfected by Isaac Barrow, 1674), may well be considered as the foundation of modern mathematics. Tangent.—The equation of the curve is $y^2 = (x-x')^2 x^2$.
a, ordinary tangent; b, nodal tangent; c, cuspidal tangent; d, inflectional tangent.

has two or more tangents at a node. A surface has a single infinity of tangents lying in one plane at an ordinary point; and two of these (real or imaginary), called the *inflectional tangents*, pass through three or more consecutive points of the surface. On the nodal curve of a surface the tangents lie in two or more tangent planes; at a conical point they are generators of a quadric cone. The tangents of a curve in space form two sets which are all generators of one developable. There are points upon some curves and surfaces at which, according to the doctrine of limits, there are no tangents. Such is the point in the second figure where the two multiple tangents intersect; for, as a second point on the curve moves toward this, the line through the two points will oscillate faster and faster, without tending toward any limit. In the same sense, a curve may have no tangent at any point; it may be an undulating line with small undulations on the large ones, and still smaller on these, and so on *ad infinitum*, the lengths and amplitudes of the undulations being duly proportioned. But an intelligence situated on such a curve might see that the tangent had a definite direction, for there is no logical absurdity in this. It is antagonistic to the principle of duality which rules modern geometry to define the tangent of a plane curve as the line through two consecutive points on the curve. On the contrary, the definition of a plane curve is a locus described by the parametric motion of a line with a point upon it, the point slipping along the line and the line turning about the point; and such a generating line is a tangent. In like manner, a surface is the locus formed by a plane with a point upon it, the position of the point in the surface and the aspect of the surface about the point varying, the one and the other, according to the variations of the same pair of independent parameters. Such a plane is a tangent plane, and a tangent may equally be conceived as the line through two consecutive ineunt points, or as the line of intersection of two consecutive tangent planes. The tangent plane of a spacious curve is a line lying in a plane and having a point upon it, the plane turning continuously about the line, the point moving along the line, and the line turning in the plane around the point as a center. Euclid's definition of a tangent ("Elements," bk. iii., def. 2) as a line meeting a circle and not crossing it when produced does not extend to curves having inflections. The definition of the tangent as the limiting case of a secant, which is due to Descartes (but was perfected by Isaac Barrow, 1674), may well be considered as the foundation of modern mathematics. (b) The length cut off upon the straight line touching a curve between the line of abscissas and the point of tangency. — 2. tanistry (tan'is-tri), *n.* [*< tanist + -ry*: see *-ery*.]
A mode of tenure that prevailed among various
Celtic tribes, according to which the tanist, or
holder of honors and lands, held them only for
life, and his successor was fixed by election.
According to this custom the right of succession was not
in the individual, but in the family to which he belonged—
that is, succession was hereditary in the family, but elec-
tive in the individual. The primitive intention seems to
have been that the inheritance should descend to the
oldest or the most worthy of the blood and name of the
deceased. This was in reality giving it to the strongest,
and the practice often occasioned bloody wars in families.

I have already called it *Tanistry*, the system under which
the grown men of the tribe elect their own chief, gener-
ally choosing a successor before the ruling chief dies, and
almost invariably electing his brother or nearest mature
male relative. *Maine, Early Law and Custom, p. 145.*

Soon after the accession of James I. a decision of the
King's Bench, which had the force of law, pronounced
the whole system of *tanistry* and gavelkind, which had
grown out of the Brehon law, and which had hitherto
been recognised in a great part of the island, to be illegal.

tannic (tan'ik), *a.* [*< tan¹* + *-ic*.] Pertaining to or derived from *tan*.—**Tannic acid**, tannin, a white uncrystallizable inodorous substance, $C_{14}H_{10}O_9$, having a most astringent taste, without bitterness. It is very soluble in water, much less so in alcohol. It has an acid reaction, and combines with most salifiable bases. It precipitates starch, albumin, and gluten, and forms with gelatin a very insoluble compound which is the basis of leather, and on which the art of tanning is founded. The word *tannin* has been loosely applied to all astringent vegetable principles. Commercially, tannic acid is of two kinds—*gallotannic acid*, derived from nutgalls, and *quercitannic acid*, which occurs in healthy leaves and bark. *Gallotannic acid* is the kind chiefly used. In medicine it is used internally as an astringent and externally as an astringent and styptic. Also called *tannin* and *digallic acid*.—**Tannic-acid ointment**. See *ointment*.

tanning (tan'ing), *n.* [Verbal *n.* of *tan¹*, *v.*]

1. The art or process of converting hides and skins into leather; the manufacture of leather. The process is chiefly chemical, and depends essentially upon the action of tannic acid, gallic acid, alum, sulphates of iron and copper, salt, and other agents on the gelatin, glutin, albumin, and other constituents of animal skins. Strictly, tanning is the treatment of hides with tannin, or tannic acid; the treatment of hides with alum and other minerals is called *tawing* (which see). In tanning proper, raw, salted, and dried hides of cattle are treated with some form of tannin, either by itself or in connection with other agents, and the product is called leather to distinguish it from the *white* or *alum leather*, *kid*, *lambskin*, etc., produced from the skins of goats, sheep, and other small animals. While a great number of plants yield tannin, the chief source of it is the bark of the oak, hemlock, birch, and beech, and the powdered leaves and young shoots of the sumac. Nutgalls are also used, as they carry gallic acid with the tannic acid. Many other vegetable matters are also used. The treatment of the hides in tanning is essentially a steeping or soaking in baths formed of extracts of tannin either by placing the ground bark directly in the baths, or by employing fluid extracts of the barks or sumacs. The hides are first freed from hair and fleshed, and are then placed in the baths. The art of tanning also includes the mechanical and chemical treatment of the hides to make them supple and water-proof. See *leather*, 1.

2. An appearance or hue of a brown color produced on the skin by the action of the sun.

Diseases and distempers incident to our faces are industriously to be cured without any thought or blame of pride: as flushings, redness, inflammations, pimples, freckles, ruggedness, *tanning*, and the like.

tan-ooze (tan'ōz), *n.* In *tanning*, an aqueous extract of tan-bark, as hemlock- or oak-bark or mixtures of these barks, or of other vegetable substances or mixtures of such substances with one another or with tan-bark, used in tanning. The ooze also usually contains in a suspended state the material or mixture of materials from which the water dissolves out the tannin in making the extract; and, after the more or less prolonged immersion therein of the hides or skins, the latter absorb a large proportion of the extracted tannin, and the ooze becomes somewhat shiny from animal matters. Also called *tan-liquor*.

tan-pickle (tan'pik'l), *n.* The liquor of a tan-pit: same as *tan-ooze*.

The charge to the public was less than it had been when the vessels were unseaworthy, when the sailors were riotous, when the food was alive with vermin, when the drink tasted like *tanpickle*, and when the clothes and hammocks were rotten.

As prepared by Berzelius, but not entirely pure, it appeared as a black powder, which assumed a grayish me-

tallic luster under the burnisher, and which when gently heated took fire, and burned to an oxide. It was discovered by Ekeberg, in 1802, in the mineral afterward named by him *ytrotantalite*, and it has since been found in various rare minerals, as tantalite, columbite, pyrochlore, fergusonite, etc., in which it is almost always associated with niobium. It also occurs in small quantities in various tin, tungsten, and uranium ores. In its chemical relations it is allied to bismuth, antimony, and niobium.

The siphon is concealed within the figure of a man, whose chin is on a level with the bend of the siphon. It has a long warp, is often dyed of many colors and embroidered with threads of gold or silver, and is used for hangings as a substitute for real tapestry.—**Tapestry velvet** or **patent velvet carpet**, tapestry Brussels cut like Wilton.—**Tapestry weaver**, one of certain rectigrade spiders of the group *Tubitela*.

tape-work (tâp'wêrk), *n.* A kind of ornamental work consisting of knots, rosettes, etc., made of tape, and connected together by braid or cord, arranged in varied patterns and sewed strongly into a continuous texture, or else worked with the crochet-needle to form a background to the figures made by the tape.

tapeworm (tâp'wêrm), *n.* An entozoic parasitic worm, of flattened or tape-like form and indeterminate length, consisting of many separable joints, found in the adult state in the alimentary canal of most vertebrate animals. Such worms belong to the order *Cestoides* or *Tæniada*, family *Tæniidae*, and several different genera, especially *Tænia*, the true tapeworms, and *Bothriocephalus*, the broad tapes. The so-called "head" of a tapeworm, small and inconspicuous in comparison with the great length to which the body may attain, is the whole of the real worm, all the rest of the joints being merely successive generative buds, which contain the matured sexual elements, and are technically called *proglottides*. They are continually budded off from the head, the oldest joint being the one furthest from the head; and any number of them may be broken off and expelled from the body without stopping their continual gemination. This is why no tapeworm can be eradicated unless the head is expelled from the host. The chain of links or joints is the strobila; it may consist of several hundred generative buds, and grow to be several yards long. These formidable parasites are parenchymatous, having no mouth nor alimentary canal, and live by absorbing nourishment from that intended to nourish the host, so that persons thus parasitized may suffer from defective nutrition while acquiring a ravenous appetite. The head of the tape is provided with hooks or suckers, or both, for adhering to the mucous membrane of the host. The ova, matured in every one of the joints, do not complete their development in the animal in which the adult exists. They require to be swallowed by some other vertebrate, the ripe proglottides being expelled from the bowel of the host with all their contained ova fertilized. The segments or proglottides decompose and liberate the ova, which are covered with a capsule. After being swallowed the capsule bursts, and an embryo, called a *proscotole*, is liberated. This embryo, by means of spines, perforates the tissues of some contiguous organ, or of a blood-vessel. In the latter case being carried by the blood to some solid part of the body, as the liver or brain, where it surrounds itself with a cyst, and develops a vesicle containing a fluid. It is now called a *scolex* or *hydatid*, and was formerly known as the *cystic worm*. The scolex is incapable of further development till swallowed and received a second time into the alimentary canal of a vertebrate. Here it becomes the head of the true tapeworm (see *tænia-head*), from which proglottides are developed posteriorly by gemination, and the adult animal with which the cycle began is thus reached. (See cut under *tænia*.) At least eight tapeworms, mostly of the genus *Tænia*, are found in man. The pork tape is *T. solium*, which in its cystic form (the so-called *Cysticercus cellulosus*) in the pig produces the disease measles (see *measles*, 2); it is acquired by those who eat

The Egyptian or dwarf tape is *T. nana*; others are the elliptic-jointed, *T. elliptica*; the crested, *T. lophosoma*; the spotted, *T. flavopuncta*. A dog-tape is *T. serrata*; its larva, called *Cysticercus pisiformis*, is the pea-meale of the rabbit. Another dog-tape is *T. oenurus*, whose larva is the cystic worm (*Cænuirus cerebrales*) of the sheep's brain, producing the gid or staggers. A third dog-tape is *T. echinococcus*, whose larva, known as *Echinococcus veterinorum*, is a common hydatid sometimes found in man. *T. marginata* of the dog is the tapeworm from the slender hydatid *Cysticercus tenuicollis* of the sheep. A cysticercus of the mouse becomes *Tænia crassidilis* in the cat. Certain cysticerci of moles taken in the fox *Tænia tenuicollis* and *T. crassiceps*. The broad tapeworm of man is *Bothriocephalus latius*, also called *Swiss tapeworm*, and another human parasite of this genus is *B. cordatus*. Tapes are also called ribbon-worms. (b) In the puddling-furnace, a small hole through which the slag, technically termed *tap-cinder*, is let out, and which during the process of puddling is stopped with sand. See diagram under *puddling-furnace*. (c) In a cementation-furnace, a small hole in one end of each pot, opposite to which is a hole in the furnace-wall, used for the insertion of "trial" or "tap" bars, so placed as to be accessible for ready withdrawal and inspection during the cementation process. A conical cavity is dug in the side of a bank or a steep hill, and a cast-iron pan is placed at the bottom, from which leads a spout into a barrel for collecting the tar. Billets of wood (such as pine or fir) are thrown into this cavity, and, being covered with turf, are slowly burned without flame. The wood chiefly used in Europe is that of the Scotch pine, *Pinus sylvestris*, and the Siberian larch, *Larix Sibirica*; in the United States, that of the long-leaved pine, *Pinus palustris*. Most of the tar produced in the United States is made in North Carolina, Virginia, and Georgia. In England wood-tar is chiefly obtained as a by-product in the destructive distillation of wood for the manufacture of wood-vinegar (pyroligneous acid) and wood-spirit (methyl alcohol). It has an acid reaction, and contains various liquid matters, of which the principal are methyl-acetate, acetone, hydrocarbons of the benzene series, and a number of oxidized compounds, as carbolic acid. Paraffin, anthracene, naphthalene, chrysene, etc., are found among its solid products. It possesses valuable antiseptic properties, owing to the creosote it contains, and is used extensively for coating and preserving timber and iron in exposed situations, and for impregnating ships' ropes and cordage. Coal-tar is extensively obtained in the process of gas-manufacture. It is a very valuable substance, the compounds obtained from it forming the basis of many chemical manufactures. See *coal-tar*.

A food-plant, *Colocasia antiquorum*, especially the variety *esculenta*, a native of India, but widely cultivated in the warmer parts of the globe, particularly in the Pacific islands. It is a stemless plant with the general habit of the caladiums of house and garden culture. The leaves are heart-shaped and about a foot long. Its chief value lies in its stem-like tuberous starchy root, which is eaten boiled or baked, made into a bread or pudding, or in the Sandwich Islands, where it is the staple food of the natives, in the form of poi (which see). The tubers, when baked, pounded, and pressed, keep fresh many months. An excellent starch can be had from them. The leaves and leafstalks are also edible, with the character of spinach or asparagus. All parts of the plant are acrid, but this quality is removed by cooking. Taro is propagated by a cutting from the top of the tuber, which, in the Fiji Islands at least, is planted as soon as the crop is gathered. About fifteen months are required to mature the root. See *Colocasia* (with cut), also *cocco*, *eddoes*, and *tanya*.

tarot (tär'ot), *n.* [*Also taroc* (= *G. tarock*) (*< It.*; *< F. tarots*, *< It. tarocchi*, a kind of checkered cards, also the game called tarot; origin obscure.)] 1. One of a pack of playing-cards first used in Italy in the fourteenth century, and so named from the design of plain or dotted lines crossing diagonally on the back of the cards. The original pack contained seventy-eight cards—namely, four suits of ten numeral cards, as in the modern game, with four coat-cards (king, queen, chevalier, and valet) in each suit, and a series of twenty-two atouts or atouts, these last being the trumps, and known specifically as the *tarots*.

tarpan (tär'pan), *n.* [*Tatar name.*] The wild horse of Tatar, belonging to one of those races which are by some authorities regarded as original, and not descended from domestic animals. Tarpans are not larger than an ordinary mule, are migratory, and have a tolerably acute sense of smell. Their color is invariably tan or mouse, with black mane and tail. During the cold season their hair is long and soft, lying so close as to feel like a bear's fur, and then it is grizzled; in summer it falls much away, leaving only a quantity on the back and loins. They are sometimes captured by the Tatars, but are reduced to subjection with great difficulty.

Its technical synonym, *M. thrissoides*, is erroneous, being based on *Clupea thrissoides* of Bloch and Schneider, 1801, and that on Broussonet's *Clupea cyprinoides*, which is the East Indian representative of this genus (*Megalops cyprinoides*), a distinct though very similar species to which the name *tarpon* or *tarpum* is extended by Jordan.

Same as *palpebral ligament* (which see under *palpebral*).—**Tarsal ossicle, sinus**, etc. See the nouns.—**Tarsal system**, a system of classification, proposed by Olivier and adopted by Latreille and other eminent entomologists, by which all coleopterous insects were arranged in sections in conformity to the real or supposed number of joints in their tarsi. These sections, as proposed by Olivier, were (1) *Pentamera*, having five joints to all the tarsi; (2) *Heteromera*, having the four anterior tarsi five-jointed and the two posterior four-jointed; (3) *Tetramera*, having four joints to all the tarsi; (4) *Trimeria*, having three joints to all the tarsi. To these Latreille added (5) *Dimeria*, having two joints to all the tarsi, and (6) *Monomera*, having but a single tarsal joint in each foot. Some of these divisions are now known to have rested on imperfect observations, and all are subject to exceptions among closely allied species; hence the tarsal system has been generally abandoned or modified, though in many respects it approached a natural classification, and, admitting the exceptions, the divisions can still be used with advantage. Its convenience is such that attempts have also been made to retain it, in its general features, with substitution of other names intended to correct the early imperfect observations, as *Cryptopentamera*, *Pseudotetramera*, *Subpentamera*, etc.; and the adjectives derived from all these terms, as *pentamerous*, *heteromerous*, etc., are regularly used in describing beetles and their tarsi.

Two of the proximal tarsals, the calcaneum and the scaphoid, are lengthened into slender rods simulating metatarsals, and bearing the true heel far above an apparent heel at the bases of the toes. The tarsus is thus about as long as all the rest of the foot, and much longer than the metatarsus. The condition of the parts is unique among mammals, though approached in some of the galagos (of the genus *Galago*). The tarsier is a small nocturnal lemur of slender form, with long hind legs, very long slender tail tufted at the end, fingered toes padded at the ends like a tree-frog's and very large eyes. It is arboreal and insectivorous, and inhabits Borneo, Celebes, Sumatra, and some other islands. It is not distinctly related to the aye-aye. See cut under *Tarsius*.

The teeth are rudimentary and variable; the tongue is vermiform and protrusile; there is no caecum; the muzzle is acute; the mandibular

rami are straight and slender without coronoid process or the inflected angle very characteristic of marsupials; and the tail is very long, slender, and prehensile. The only species, *T. rostratus*, is of the size and somewhat the appearance of a mouse, and inhabits western Australia, living in trees and bushes, and feeding on insects and wild honey.

tarsus.] The single compound bone of some animals, especially birds, resulting from the combination of tarsal and metatarsal bones in one. This formation occurs in all birds and probably some reptiles. In the former the three principal metatarsal bones fuse into one, the fourth metatarsal remaining distinct or only incompletely joined to the rest; and to the proximal extremity of the compound metatarsal thus formed are also ankylized the elements of the distal tarsal series.

The result is similar to that seen in the compound cannon-bone of hoofed quadrupeds, though this has no tarsal elements. The tarsometatarsus is a comparatively large stout bone, extending from the heel or suffrago to the bases of the toes. It corresponds to that part of the foot commonly called the *tarsus* in descriptive ornithology, and is usually naked and scaly, though sometimes feathered. Its proximal extremity usually presents a large bony protuberance (the so-called calcaneum or hypotarsus), perforated for the tendons of certain muscles, and the distal extremity is divided into three prongs (two in the ostrich), each bearing an articular surface for one of three toes (the first toe, or hallux, when present, being differently attached to the foot by an accessory metatarsal). The bone is nearly always compressed, or of less width than depth; but in the penguins it is broad from side to side and shows two fontanelles, or vacant spaces, indicating its triple composition. It is often called simply *metatarsus*, its tarsal elements being ignored. See also cut under *metatarsus*.

It is often called simply *metatarsus*, its tarsal elements being ignored. See also cut under *metatarsus*.

tarsotarsal (tär-sō-tär'säl), *a.* [*< tarsus + tarsus + -al*.] Mediotarsal, as the ankle-joint of birds and reptiles, which is situated between the two rows of tarsal bones, and not between the tibia and the tarsus as in mammals.

tarsotibial (tär-sō-tib'i-al), *a.* [*< tarsus + tibia + -al*.] Same as *tibiotarsal*.

tarsus (tär'sus), *n.*; pl. *tarsi* (-si). [= *F. tarse, < NL. tarsus, < Gr. τάρσος, any broad flat surface, as for warming or drying things upon* (τάρσος ποδός, the flat of the foot), < τέρεσθαι, dry, dry up: see *terra, thirst*.] **1.** *In zool. and anat.*, the proximal segment of the pes or foot, corresponding to the carpus of the manus or hand; the collection of bones between the tibia and the metatarsus, entering into the construction of the ankle-joint, and into that part of the foot known in man as the instep. It consists in man of seven bones: the astragalus or hucklebone, alone supporting the leg; the calcaneum, or heel-bone; the scaphoid or navicular bone; the cuboid, supporting the two outer metatarsals; and three cuneiform bones, supporting the other three metatarsals. The tarsal bones tend to arrange themselves in two rows, called the *proximal* and *distal* rows; in man the first three just named belong to the proximal row. A generalized tarsus, as found in some reptiles, consists of nine tarsal bones: an outer proximal, the fibulare; an inner proximal, the tibiale; one between these, the intermedium; a central one, the centrale; with five in a distal row, one for each metatarsal, called *tarsalia*, and distinguished as tarsale I-V from inner to outer side. Various suppressions, confluences with one another or with other bones, or additions to the number occur, destroying the symmetry of the typical tarsus; but seven is the normal mammalian number, as in man, where the astragalus is supposed to = the tibiale + intermedium; the calcaneum = fibulare; the scaphoid = centrale; the cuboid = tarsale IV + V; the three cuneiforms = tarsalia I, II, III. In all *Mammalia* the ankle-joint is between the tarsus and the tibia, or tibiotarsal; in all vertebrates below *Mammalia* which have a tarsus the ankle-joint is among the tarsal bones, between the proximal and distal rows, and therefore mediotarsal. Birds offer the most exceptional case, there being apparently no tarsus, or tarsal bones, in the adult. This appa-

Right Tarsus of an Amphibia (*Salamandra*), showing nearly symmetrical disposition of the tarsal bones: I, tibia; F, fibula; r, tibiale; f, fibulare; c, centrale; these are tarsal bones of the proximal series; r-5, the five tarsalia, or distal tarsals, known as tarsale 1, tarsale 2, etc.; I-V, the corresponding five digits or phalanges.

rent anomaly is explained by the fact that the embryo has several tarsal elements, proximal ones of which become consolidated with the tibia as the condyles of the latter, and distal ones of which become similarly fused with the principal metatarsal bone. Hence, a bird's tibia is really a tibiotarsus, and a bird's principal metatarsal bone is really a tarsometatarsus; and the ankle-joint, apparently between the tibia and the metatarsus, is really mediotarsal, as is usual below mammals. See cuts under *booted*, *Catarrhina*, *digitigrade*, *Equidae*, *foot*, *metatarsus*, *Plantigrade*, and *Plesiosaurus*.

In *entom.*: (a) The foot; the terminal segment of any leg, next to and beyond the tibia, consisting of a variable number of joints, usually five, and ending sometimes in a pair of claws like pincers, or in a sucker-like pad, or otherwise. It normally consists of five joints, but some of these may be very small or entirely aborted, and in a few insects there is only one joint. These modifications are much used in classification, especially of beetles. (See *tarsal system*, under *tarsal*.) The joints are distinguished by numbers, the first being that attached to the tibia (in bees sometimes called the *planta* or *palm*, and in flies the *metatarsus*). The last joint is generally terminated by two hooks or claws called *ungues*, with a little piece, the onychium, between them, which Huxley regards as a sixth joint. (See *ungues*.) The tarsi serve the same purposes as the feet of vertebrate animals. See cuts under *coxa*, *Eurolytus*, *mole-cricket*, *Pentamera*, and *Tetramera*. The reason given by Paracelsus, "because it produces oil, water, tincture, and salt, which burn the patient as *Tartarus* does," is evidently imagined; but the word was no doubt connected with *L. Tartarus* in some vague way. It is said to be of *Ar.* origin, but it could not come, except by very unusual corruption, from the *Ar.* word given as its source, viz. *Ar. (and Pers.) durd*, dregs, sediment, the *tartar* of wine, the mother of oil; cf. *Ar. durdi*, *Pers. durdi*, dregs, sediment; *Ar. darad*, a shedding of the teeth, *darda*, a toothless woman—referring, according to Devic, to the *tartar* on teeth.] 1. The first-named is the commercial article. It crystallizes in large rhombic prisms, transparent and colorless, and very soluble in water. It is inodorous, and very sour to the taste. Tartaric acid is dibasic; its salts are called *tartrates*, and have a most remarkable disposition to form double salts, such as Rochelle salts, double potassium sodium tartrate, tartar emetic, double potassium antimony tartrate, etc. Tartaric acid is found in the free state in grape-juice, tamarinds, and many fruits, but chiefly in the form of acid potassium tartrate. It is obtained commercially from this salt, called *argol*, which deposits in crusts from fermenting wines. The purified salt is called *cream of tartar*. The tongue is also supplied with nerves of common sensation or touch, and in some cases it is difficult to distinguish between such a sensation and that arising from the exercise of the sense of taste.

=Syn. 3. *Taste, Savor, Flavor, Smack.* *Taste* is the general word, so far as the sense of *taste* is concerned: as, the *taste* of an apple may be good, bad, strong, woody, earthy, etc. *Savor* and *flavor* may apply to the sense of *taste* or to that of smell. *Savor* in *taste* generally applies to food, but is otherwise rather indefinite: as, to detect a *savor* of garlic in soup. *Flavor* is generally good, but sometimes bad: it is often the predominating natural *taste*: as, the *flavor* of one variety of apple is more marked or more palatable than that of another. *Smack* is a slight *taste*, or, figuratively, a faint smell, generally the result of something not disagreeable added to the thing which is tasted or smelled: as, a *smack* of vanilla in ice-cream; a *smack* of salt in the sea-breeze.—6. *Taste, Sensibility.* *Taste* is active, deciding, choosing, changing, arranging, etc.; *sensibility* is passive, the power to feel, susceptibility of impression, as from the beautiful.—7. *Taste, Judgment.* As compared with *judgment*, *taste* always implies esthetic sensibility, a sense of the beautiful, and a power of choosing, arranging, etc., in accordance with its laws. *Judgment* is purely intellectual. taunt¹ (tânt or tânt), *v. t.* [Early mod. Skeat also quotes a passage from Udall, tr. of "Erasmus's Apophthegms," Diogenes, § 68, "Geuyng vnto the same *taunt pour taunte*, or one for another," suggesting an origin in the F. phrase *tant pour tant*, 'so much for so much': see *tantity*. There is no evidence that the sense was affected by OF. *tanser*, *tancer*, *tenser*, F. *tancer*, check, scold, reprove, *taunt*, < ML. as if **tentiare*, from the same source as *tentare*.] 1. Originally, to tease; rally; later, to tease spitefully; reproach or upbraid with severe or insulting words, or by casting something in one's teeth; twit scornfully or insultingly.
 Sometime *taunting* w/oute displeasure, not w/out disport.

Heywood, Hierarchy of Angels, p. 10.
 =Syn. 1. *Ridicule*, *Chaff*, *Deride*, *Mock*, *Upbraid*, *Taunt*, *Flout*, *Twit*. We may *ridicule* or *chaff* from mere sportiveness; we may *ridicule* or *upbraid* with a reformatory purpose; the other words represent, and all may represent, an act that is unkind. All except *mock* imply the use of words. As to *ridicule*, see *ludicrous*, and *banter*, *v.* and *n.* *Chaff*, which is still somewhat colloquial, means to make fun of or tease, kindly or unkindly, by light, ironical, or satirical remarks or questions. *Deride* expresses a hard and contemptuous feeling: "*derision* is ill-humored and scornful; it is anger wearing the mask of *ridicule*" (C. J. Smith, Syn. Disc., p. 667). It is not always so severe as this quotation makes it. *Mock* in its strongest sense expresses the next degree beyond *derision*, but with less pretense of mirth (see *imitate*). We *upbraid* a person in the hope of making him feel his guilt and mend his ways, or for the relief that our feelings find in expression; the word is one degree weaker than *taunt*. To *taunt* is to press upon a person certain facts or accusations of a reproachful character unsparingly, for the purpose of annoying or shaming, and glorying in the effect of the insulting words: as, to *taunt* one with his failure. To *flout*, or *flout at*, is to *mock* or insult with energy or abruptness; *flout* is the strongest of these words. To *twit* is to *taunt* over small matters, or in a small way; *twit* bears the relation of a diminutive to *taunt*.
taunt¹ (tânt or tânt), *n.* [Also dial. *tant*; < *taunt*¹, *v.*] 1. Upbraiding words; bitter or sarcastic reproach; insulting invective.

tax (taks), *n.* [*< ME. tax, taxen, < OF. A disagreeable or burdensome duty or charge; an exaction; a requisition; an oppressive demand; strain; burden; task.—2. An enforced proportional contribution levied on persons, property, or income, either (a) by the authority of the state for the support of the government, and for all its public or governmental needs, or (b) by local authority, for general municipal purposes. In a more general sense the word includes assessments on specific properties benefited by a local improvement, for the purpose of paying expenses of that improvement. Taxes, in the stricter sense, are direct when demanded from the very persons who it is supposed as a general thing will bear their burden: as, for example, poll-taxes, land or property taxes, income taxes, taxes for keeping man-servants, carriages, or dogs. Taxes are said to be indirect when they are demanded from persons who it is supposed as a general thing will indemnify themselves at the expense of others—that is, when they are levied on commodities before they reach the consumer, and are paid by those upon whom they ultimately fall, not as taxes, but as part of the market price of the commodity (*Cooley*): as, for example, the taxes called *customs*, which are imposed on certain classes of imported goods, and those called *excise duties*, which are imposed on certain home manufactures and articles of inland production. In the United States all state and municipal taxes are direct, and are levied upon the assessed values of real and personal property, while the revenue required for general governmental purposes is derived from indirect taxes upon certain imports, and upon whisky, tobacco, etc. In the United Kingdom the governmental revenues are derived from both direct and indirect sources—from taxes on income, stamps, dogs, etc., from imposts on a few imported articles of consumption, especially tea, spirits, tobacco, and wines, and from excise duties. House taxes, or taxes on rental, form the largest part of the local rev-

states, municipal revenues being entirely raised from this source. See phrases below.

Since (banthous Prince) on me and my Descent
Hem doest impose no other tax nor Rent
But of sole Precept, of most just condition

Income tax. See *income*.—**Inheritance tax law**. See *inheritance*.—**Poll tax**. See *poll-tax*.—**Single tax**, in economics, taxation solely on land-value, to the exclusion of other taxation by the same state. According to the theory advocated in recent times by Henry George and others, this tax should supersede all others, and should fall only on valuable land, exclusive of the improvements on such land.

The *single tax*, in short, would call upon men to contribute to the public revenues not in proportion to what they produce or accumulate, but in proportion to the value of the natural opportunities they hold. It would compel them to pay just as much for holding land idle as for putting it to its useful use.
Henry George, *Single Tax Platform*.

See *window*.
Syn. 2. *Tax*, *impost*, *duty*, *customs*, *toll*, *rates*, *excise*, *assessment*, *tribute*. *Tax* is the general word for an amount demanded by government for its own purposes from those who are under its authority. *Imposts*, *duties*, and *customs* are levied upon imports or exports, but *impost* applies to any tax viewed as laid on. *Toll* and *rates* are certain local taxes; as, *toll* at a bridge, ferry, or plank-road; *church-rates* and *poor-rates* in England, *water-rates*. *Excise* is a precise word in England (see *def.*); its most frequent use is in connection with malt and spirituous liquors. *Assessment* is either (a) the valuation of property for the purpose of its taxation; (b) the imposing of the tax; or (c) a charge on specific real property of a share of the expense of a local improvement specially benefiting that property. *Tribute* views the tax as laid not for the public good, but arbitrarily for the benefit of the one levying it, especially a conqueror; as, "Millions for defense, but not one cent for tribute." Each of these words had its older, peculiar, or figurative uses. See definitions of the words and also of *subsidy*.

As constituted by Eichler, it includes 15 or 20 species of 5 genera, mostly of northern temperate regions. It is characterized by dioecious flowers, the pistillate in aments of imbricated scales, of which several or only the terminal one is fertile, and by a solitary erect or afterward oblique ovule which is surrounded or partly inclosed by the hollowed apex of a sessile or stalked lamina free from its accompanying bract. The genus *Ginkgo* is exceptional in bearing an ovule on each lobe of a two- to six-parted lamina, *Cephalotaxus* in its small adnate lamina with twin ovules, and *Phyllocladus* in its mucous flowers. Only one genus, *Taxus* (the type), is of wide distribution. *Cephalotaxus* and *Ginkgo* occur only in China and Japan; *Torreya* there and in the United States; *Phyllocladus* in Tasmania, New Zealand, and Borneo. The tribe *Taxeæ* of Benth and Hooker (1850) differs in excluding *Cephalotaxus* and including two chiefly Australian genera, *Dacrydium* and *Phorosphera*, now united and placed in *Taxodiææ*.

It differs from *Meles* and other meline genera in many important cranial and dental characters, as well as in external form. The teeth are 34, with only 1 true molar above and 2 below on each side. Bentham and Hooker (1880), retaining the name *Taxodiæ*, altered the tribe by excluding the genera *Cunninghamia* and *Sciadopitys*, and by including *Cephalotaxus*; and in this form the tribe coincides with the *Taxodineæ* of Goebel (1882), except that the latter excludes *Cephalotaxus*.

Taxodineæ (tak-sō-dī'nē), *n. pl.* [NL. (A. W. Eichler, 1887), *< Taxodium + -ineæ*.] A subtribe of conifers, classed under the tribe *Abietineæ*, and including 12 species, belonging to 7 genera, differing widely both in characters and in locality, some of them among the most remarkable of all known trees. Several inhabit Japan or China or both, as *Glyptostrobus*, including two small species, and *Sciadopitys*, *Cunninghamia*, and *Cryptomeria*, all monotypic genera of lofty trees. A second group, of three species of small or middle-sized trees, the genus *Athrotaxis*, occurs in Tasmania and Victoria. The remaining or North American group consists of the two genera *Taxodium* and *Sequoia*, each of two species, all attaining either an immense height or girth or both. See *Taxodium* (the type), also *Sequoia*, *Sciadopitys*, and *Cunninghamia*. Compare *Taxodiææ*.

Taxodium (tak-sō'di-um), *n.* [NL. (L. C. Richard, 1810), *< Gr. taxis*, yew, + *eidōs*, form.] A genus of coniferous trees, of the tribe *Abietineæ*, type of the subtribe *Taxodineæ*. It is characterized by a globose or obovoid cone composed of scales with an entire margin, at the apex woody, dilated, and truncate, on the back umbonate or mucronate, and including the two irregularly three-angled seeds, which contain six to nine cotyledons. There are two species, natives of the United States and Mexico. They are loosely branched

closely crowded with spirally set scales. The fruit is a hard round cone, an inch long, with its very thick angular peltate stalked scales gaping apart at maturity, but persisting after the fall of the seeds, which are large, shining, and coriaceous or corky on the surface. *T. distichum*, the bald or red cypress of the United States, is characteristic of southern swamps near the sea-coast, occupying large tracts to the exclusion of other trees, and extending often into deep water around lake-margins. It occurs from Delaware to Texas, and also in the Mississippi and Ohio valleys to Indiana and Illinois. It often reaches a great size, sometimes 150 feet in height and 36 in girth, and furnishes a valuable wood which is soft, close, easily worked or split, and very durable, and is much employed for cooperage, railway-ties, fences, posts, and shingles. It is almost indestructible in water or in contact with earth, but is often injured, especially beyond the Mississippi, by a fungus, a species of *Dedalea*. Two varieties are distinguished by lumbermen—the *white cypress*, with light-brown wood, and the *black cypress*, with dark-brown harder and more durable wood, at first heavier than water; the sap-wood of both is nearly white. The tree is also the source of an essential oil, a superior turpentine, and a medicinal resin, and from the beauty of its feathery foliage it is valued for lawn cultivation. It is especially remarkable for its habit, when growing under water, of throwing up large smooth conical projections known as *cypress-knees*, commonly 2 (sometimes 7) feet high, covered with reddish bark like the roots, and hollow, as is the base of the tree itself. They are by some supposed to be aerating organs, by others to serve as braces to afford a stable lateral support in the yielding bottom, and by others to be undeveloped or arrested tree-trunks. (Compare *cypress-knee*, *knee*, 3(d), and *cypress*.) The tree itself often rises out of water as a straight gray shaft 50 or 90 feet high before dividing into its flat spreading top, its base ribbed by large projecting buttresses, each continuous below with a strong and branching root, from horizontal branches of which the knees arise. The tree is also remarkable for its great longevity, growing rapidly at first, in cultivation sometimes adding an inch in diameter a year, but soon becoming as slow-growing as the yew, and adding only an inch in twelve to thirty years. The other species, *T. mucronatum*, the Mexican cypress, or ahuehete, forms extensive forests in the Sierra Madre, at elevations from 4,000 to 9,000 feet, itself often reaching 70 to 100 feet high, with longer and pendulous branchlets and more persistent greener leaves. It attains even a greater size and age than *T. distichum*; the celebrated *cypress of Montezuma*, in the gardens of Chapultepec, variously estimated from 120 to 2,000 years old, is 41 to 45 feet in girth and about 120 feet high; one at Atlitico is about 76 feet, and another near Oaxaca, 112 feet in girth; the latter was estimated by A. de Candolle and Asa Gray to be at least 4,000 years old. A third species, *T. heterophyllum* (for which see *water-pine*, under *pine*), is now separated as *Glyptostrobus heterophyllum*, on account of its obovoid cone and stalked seeds. The genus is of great antiquity geologically, being found in the Cretaceous and in great abundance in the Tertiary of nearly all parts of the world.

Taxodiææ (tak-soi'dē-ē), *n. pl.* [NL. (A. W. Eichler, 1887), *< Taxus + Gr. eidōs*, form, + *-ææ*.] 1. A tribe of conifers, of the suborder *Taxaceæ* (the suborder *Taxodiææ* of Eichler), distinguished from *Taxaceæ*, the other tribe within that suborder, by the absence of any bracteoles around the ovules. It includes about 54 species, of 4 genera, two of which are monotypic, *Sageo-gothæa*, a small yew-like tree of Patagonia, and *Microcachrys*, a prostrate shrub of Tasmania. For the others, see *Podocarpus* and *Dacrydium*. The tribe as now received coincides with the *Podocarpeæ* of previous authors with the addition of *Dacrydium*. 2. Taxus (tak'sus), *n.* [NL. (Tournefort, 1700), *< L. taxus = Gr. taxis*, a yew-tree.] A genus of conifers, the yews, type of the tribe *Taxææ* and suborder *Taxaceæ*. It is characterized by mostly dioecious flowers, the female solitary and consisting of a single erect ovule on a small annular disk, which soon becomes cup-shaped and fleshy, and finally forms a pulpy berry inclosing the seed, but free from it and open at the truncate apex. The small globose male flowers are solitary in the axils, surrounded by a few imbricated scales, with a short stalked stamen-column, five to eight roundish depressed and furrowed anthers, which become almost umbrella-shaped and four- to six-lobed after maturity, and bear three to eight cells connate into a ring. The ripened seed is hard, woody, and nut-like, somewhat viscid when fresh, and contains an embryo of two cotyledons. There are 6 or 8 species, by some considered all varieties of one, natives all of the northern hemisphere and widely dispersed. They are evergreen trees or shrubs, bearing short-petioled flat linear rigid leaves which are somewhat spirally inserted, but usually spread falcately into ranks. The genus is remarkable for the great variation within the same species, *T. baccata*, the yew, seldom exceeding 15 or 20 feet in height in England, but in the Himalayas becoming a naked trunk 30 feet high and often 16 in girth, its top reaching 70 or, it is said, sometimes 100 feet in height. *T. brevifolia* is similarly a low shrub in Montana, but a stately tree sometimes 75 feet high near the Pacific. *T. canadensis*, the ground-hemlock, formerly regarded as a variety of the British species, usually a prostrate shrub, extends from New Jersey and Iowa northward, generally under evergreens. The other North American species, *T. floridana* of West Florida and *T. globosa* of Mexico, are small trees, as are those of Japan, where *T. cuspidata* is cultivated and many curious varieties have been produced. The genus is similar to *Taxodium* in its slow growth, and remarkable for the great bulk attained by older trees, as the celebrated Ankermyke yew near Staines, in England, within sight of which the Magna Charta was signed, which is 27½ feet in girth; the Tisbury yew in Wilts. 37 feet; and the Fortingall yew in Perthshire, 56½; the first of these was estimated by Asa Gray to be at least 1,100 years old, and the second 1,600. It was sharply opposed to Tylerism.

A product consisting of the prepared leaves of the tea-plant (see def. 2), of various kinds and qualities depending chiefly on the method of treatment. Black teas manufactured by a process of withering under the influence of light, heat, and air, rolling, fermenting, sun-drying and firing (drying with charcoal in a stove); green tea by a more rapid process without the withering and fermenting, and with more firing. Among the chief black teas are *hibida*, *conat*, *souchong*, *carpenter*, *indian*, and *pekee*; among the green, *tyouanay*, *hyson skin*, *young hyson*, *london imperial*, and *gunpowder*. The gunpowder is the finest green, the pekee the finest black, both being made from the first pickings. *Shouan pekee* from leaves so young as to be still covered with down. A third group of teas is known as the *scented*, generally of poorer quality,

flavored with the flowers of the fragrant olive (see *Osmanthus*), of the chulan, and sometimes of the Cape jasmine (see *Gardenia*) and of other plants. This classification applies more especially to Chinese teas. Tea became known in Europe during the seventeenth century. Among western nations the greatest consumers of tea are Great Britain, Russia, and the United States.

2. The tea-plant, *Camellia theifera*, often named *Thea sinensis* (or *Chinensis*). The tea-plant is a shrub from 3 to 6 feet high, with leaves from 4 to 8 inches

long and from 1½ to 2½ inches broad, and tapering toward both ends; the flowers are white, and about 1½ inches broad. The cultivated plant is of a more contracted habit, with smaller, more obtuse, and leathery leaves. The plant is known to grow wild in upper Assam, the form there found having sometimes been distinguished as *Thea Assamica*, forming, with its varieties, Assam tea. The Assam plant is much superior to the Chinese, and the teas most planted are hybrids of the two. The Chinese tea has two varieties, formerly distinguished as *Thea Bohea* and *T. viridis*, black and green tea; but either kind of tea can be made from either plant. China is the great seat of tea-culture; but tea is also extensively grown in Japan, having been

introduced in the reign of Saga Tennō (A. D. 810–23), also in India and Java. Promising experiments have been made in Madagascar, Natal, Jamaica, etc. In the United States it can be grown successfully in the South and in California; but the cost of labor has thus far prevented its economic success.

3. An infusion of the prepared leaves of the tea-plant, used as a beverage, in Great Britain and America commonly with the addition of a little milk or sugar, or both, in continental Europe often with a little spirit, in Russia with lemon, and in China and neighboring countries without any admixture. Its action is stimulating and invigorating, and, owing to the presence of tannin, more or less astringent. Its main quality depends upon the alkaloid therein; the leaf contains also volatile oils, which give it its fragrance, and some other substances. Excessive use, especially of green tea, affects the nervous system unfavorably. While tea contains but trifling nutriment, it is held to retard the waste of the tissues and diminish the need of food.

A drop or small quantity of the limpid fluid secreted by the lacrimal gland, appearing in the eye or falling from it; in the plural, the peculiar secretion of the lacrimal gland, serving to moisten the front of the eyeball and inner surfaces of the eyelids, and on occasion to wash out the eye or free it from specks of dirt, dust, or other irritating substances. Tears, like saliva, are continually secreted in a certain quantity, which is speedily and copiously increased when the activity of the gland is excited either by mechanical stimulation or by mental emotion. Any passion, tender or violent, as joy, anger, etc., and especially pain or grief, may excite the flow of tears, which is also immediately provoked by pain, especially in the eye itself. The tears ordinarily flow unperceived through the lacrimal canal or nasal duct into the nose; when the supply is too copious they overflow the lids and trickle down the cheek. Tears consist of slightly saline water, having an alkaline reaction.

She whassched his Feet with hire *Teres*, and wyped hem with hire Heer.

It is observed, for instance, that when a wine-glass partially filled with port wine is allowed to stand, the alcohol evaporates more rapidly than the water present with it; hence the latter tends to increase in proportion, and because of its higher surface-tension creeps up on the surface of the glass, dragging the other liquid with it, till drops are formed which roll down the sides again.

=**Syn.** 3. *Tease*, *Vex*, *Annoy*, *Molest*, *Badger*, *Pester*, *Bother*, *Worry*, *Plague*, *Torment*. All these words either may or must refer to repeated acts; they all suggest mental pain, but of degrees varying with the word or with the circumstances; all except *badger* and *molest* may be used reflexively, but with different degrees of appropriateness, *vex*, *worry*, and *torment* being the most common in such use; the agent may be a person, or, except with *badger*, it may be a creature, events, circumstances, etc.; it would be clearly figurative to use *tease* when the agent is not a person; all except *tease* are always used seriously. *Tease* is not a strong word, but has considerable breadth of use: a child may *tease* his mother for what he desires; there is a great deal of good-humored *teasing* of friends about their matrimonial intentions; a fly may *tease* a dog by continually waking him up. *Vex* is stronger, literally implying anger and figuratively applying to repeated attacks, etc., such as would produce an excitement as strong as anger. In Shakspeare's "still-vex'd Bermoothes" (Tempest, i. 2. 229), the use of *vex* is somewhat poetic or archaic, as is the application of the word to the continued agitation of the sea. *Annoy* has a middle degree of strength between *tease* and *vex*; a feeling of annoyance is somewhat short of *teazation*. We may be *annoyed* by the persistence of flies, beggars, duns, suitors, picket-firing, etc. *Molest* is generally a stronger word in its expression of harm done or intended, including the sense of disturbing once or often: some wild animals will not *molest* those who do not *molest* them. The next four words have a homely force—*badger* being founded upon the baiting of a badger by dogs, and thus implying persistence, energy, and some rudeness; *pester* implying similar persistence and much small vexation; *bother* implying weariness and perhaps confusion of the mind; and *worry* implying actual fatigue and even exhaustion. *Plague* and *torment* are very strong by the figurative extension of their primary meaning, although they are often used by hyperbole for that which is intolerable only by constant return: as, a *tormenting* fly. See *exasperate* and *harass*.

tea-tree (tē'trē), *n.* 1. The common tea-plant or tea-shrub. See *tea*, 2.—2. A name of various myrtaceous and other plants, chiefly of the genera *Leptospermum* and *Melaleuca*, found in Australia, Tasmania, and New Zealand. See phrases below. Very abundant and conspicuous, especially in New Zealand, is *L. scoparium*, the broom tea-tree, known also as *tea-scrub*. It is an erect rigid shrub, or in the mountains prostrate, from 1 to 12 feet high, forming dense thickets, with leathery sharp-pointed foliage, covered for two months with abundant small white blossoms. Its wood, though small, is hard and useful for turning, etc. *L. lanigerum*, the Tasmanian tea-tree (found also in Australia), is a somewhat larger, very abundant shrub or tree, with a hard even-grained wood. The leaves of both are reputed to have been used by Captain Cook or early colonists as tea, which may account for the name, but the native Australian name of the former is *t. Melaleuca uncinata*, the common tea-tree, is a shrub, or sometimes a tree from 40 to 80 feet high, with hard, heavy, durable wood, widely diffused in Australia.

Even the grass itself is not indigenous, all these hills (in New Zealand) having till recently been densely clothed with a thicket of *tea-tree*, which is a shrub somewhat resembling Juniper or a gigantic heather-bush, its foliage consisting of tiny needles, while its delicate white blossoms resemble myrtle. It is called by the Maoris *manakau*, but the settlers have a tradition that Captain Cook and his men once made tea of its twigs; hence, they say, the name. It is, however, noteworthy that this plant is called *t. t.* by the Australian blacks, so it is probable that the name was brought thither by some colonist from the sister isle.
